EXECUTIVE SUMMARY

Only data collected during the period February 1, 1990 to January 31, 1991 are presented in this report. While a limited amount of the data were collected as "audit" samples by the Ontario Ministry of the Environment, most of the data were collected by or for the Ontario metal mining industry under Ontario Regulation 491/89 as amended to Ontario Regulation 44/90.

The data presented in this report are considered to accurately represent the general nature of effluents discharged by active properties within the sector for the period February 1, 1990 to January 31, 1991. Plants within the sample group accounted for more than 95% of production within the metal mining sector.

During the period February 1, 1990 to January 31, 1991, the Ontario metal mining industry processed approximately 100,000 tonnes of ore per day and discharged approximately 695,000 cubic meters (153,000,000 gallons) of wastewater per day.

Approximately 50% of the data collected during the period February 1, 1990 to January 31, 1991 were related to quality assurance/quality control procedures. Over 80,000 data points were directly related to effluent quality.

Effluents within the sector were analyzed for 150 parameters. After quality assurance/quality control procedures had been applied to the data, 42 parameters remained for further consideration.

Of the 42 parameters remaining for further consideration, 13 were metals such as copper, nickel and zinc; 9 were organics such as xylene, cresol, benzene and toluene; and 20 were conventional parameters such as suspended solids, ammonia, cyanide and chemical oxygen demand.

Not all parameters occurred at each property. Many of the conventional parameters were found in the effluents at most properties. Some metals, such as copper, were found at more than half of the properties in the sector. Chromium, on the other hand, was found at only one property.

Of the 9 organics found in sector effluents, chloroform, benzene and toluene were found at two properties each. Carbon tetrachloride, methylene chloride, meta, para and ortho xylene, 2-methylnaphthalene, naphthalene and meta and para-cresol were found at one property each.

The total annual loadings of the 9 organics found in metal mining sector effluents were as follows:

<u>PARAMETER</u>	<u>KG/YEAR</u>
toluene	40.7
meta and para cresol	25.0
ortho, meta and para xylene	22.7
carbon tetrachloride	12.5
methylene chloride	10.8
benzene	10.3
2-methylnaphthalene	8.4
naphthalene	6.5
chloroform	6.4

The total annual loadings of the 13 metals found in metal mining sector effluents were as follows:

<u>PARAMETER</u>	<u>KG/YEAR</u>
iron	100,000
nickel	59,000
zinc	40,900
copper	37,700
aluminum	33,100
molybdenum	6,370
cobalt	5,260
uranium	3,530
antimony	1,770
lead	1,470
cadmium	723
mercury	540
chromium	20

The total annual loadings of significant conventional parameters found in metal mining sector effluents were as follows:

<u>PARAMETER</u>	<u>KG/YEAR</u>
cyanide (total)	44,800
cyanide (weak acid dissociable)	13,300
cyanates (filtered)	34,800
thiocyanates (filtered)	848,000
ammonia plus ammonium	1,580,000
nitrate plus nitrite	1,930,000
suspended solids	2,110,000
dissolved solids	293,000,000
sulphates	153,000,000
chlorides	16,500,000
phenolics (4AAP)	1,840
arsenic	12,500
selenium	9,590

PARAMETERKG/YEAR

phosphorus	3,280
chemical oxygen demand	6,400,000

Wastewaters generated by the metal mining sector may be held for long periods of time before release to the environment. Retention times of six months to one year are common.

There were 69 sampling points listed in the Metal Mining Sector Effluent Monitoring Regulation as amended. However, due to factors such as the variable nature of operations within the industry, the number of sampling points at any one time during the monitoring period was closer to 50.

Plants monitored within the sector, in general, did not operate on a continuous basis throughout the monitoring period. In addition, many operating plants held wastes for varying lengths of time in order to make use of a waste treatment process termed "natural degradation". This has been a common practice within the industry for a number of years. In general, there is no effluent discharge while wastes are being held.

INTRODUCTION

The Municipal and Industrial Strategy for Abatement (MISA) is a regulatory program aimed at the virtual elimination of persistent toxic contaminants from all discharges into Ontario's waterways.

This goal will be achieved by:

- identifying and measuring the discharge of toxic substances and conventional contaminants in order to build up a comprehensive data base on contaminants discharges across Ontario
- increasing the emphasis on control technology through the application of Best Available Technology Economically Achievable (BATEA) to obtain greater reductions of pollution at source

In the first phase of the program, effluent monitoring regulations required dischargers to monitor their point source effluents at regular intervals according to specific sampling, analytical, quality control and quality assurance protocols and procedures.

The second phase of the program involves the development and implementation of effluent limit regulations using the information gathered by the effluent monitoring regulation together with available information on Best Available Technology Economically Achievable.

This report summarizes information generated by the Metal Mining Sector Effluent Monitoring Regulation (Ontario Regulation 491/89).

SECTOR OVERVIEW

The Canadian Shield is one of the largest and richest mining areas in the world. A large portion of the Shield lies within the boundaries of the Province of Ontario.

Metal mining operations in Ontario follow two basic patterns: open pit and underground. Of the two, underground operations predominate. It is not unusual, however, for open pit mining to precede conventional underground mining at any particular property providing that the geology and ground conditions are suitable.

There are standard mining procedures but the varying shapes of orebodies and changeable geology result in no two mines ever being exactly the same.

Mines range all the way from the early prospect which may have only a single level with limited lateral workings to the deep and complex workings of mines that have been in production for many years. Many Ontario mines reach depths of over 1 kilometer and many Ontario mines have more than 100 kilometers of workings underground.

Few businesses are subject to the constant pressures that the mining industry must face. Mines around the world produce almost identical products. Competition is intense. In addition, ore reserves at any property are finite and largely determine how long a property can be operated. With relatively short lives when compared to other industries, mines are forced to adopt or adapt technology that is available, economic and competitive on a global basis.

The data in this report are based on the Ontario Metal Mining Sector as it existed from February 1, 1990 to January 31, 1991. At that time, the Sector consisted of over 40 metal mining properties. This total included 3 inactive properties with operating mechanical treatment systems. The data in this report are based on approximately 50 direct discharges to the environment.

During the period February 1, 1990 to January 31, 1991, the Ontario Metal Mining Sector processed approximately 100,000 tonnes of ore per day and discharged approximately 695,000 cubic meters (153,000,000 gallons) of wastewater per day.

For the purposes of the Metal Mining Effluent Monitoring Regulation, the Metal Mining Sector was divided into the following subsectors:

- copper, lead, zinc, nickel
- gold
- iron
- salt (sodium chloride)
- silver
- uranium

At the time of writing (March, 1992), the salt subsector had been transferred to the Industrial Minerals Sector. No silver mines were operating and only one iron mine was operating. In addition, a public announcement had been made that all remaining uranium mines in the Province would be closing. As a consequence, at the time of writing, the Metal Mining Sector in Ontario consisted largely of copper, lead, zinc, nickel and gold operations.

The annual precipitation in the metal mining regions of Ontario consists of approximately 79 centimetres of rain and 285 centimetres of snow. Summer temperatures in excess of 25 degrees Celsius and winter temperatures below minus 30 degrees Celsius are common. It should be noted that most metal mines in the United States are located in arid or "rain shadow" regions.

Even though the industry discharged approximately 153,000,000 gallons of wastewater per day during the monitoring period, this amount of water represents only a small portion of the water that is actually used in the operations. Routinely, over 75 per cent of all water required at an Ontario mine/mill operation is obtained by recycling wastewater.

Natural water that percolates into a mine and the water that is deliberately pumped into a mine for use may come into contact with a variety of substances that can include reactive mineralized rock, mine-machinery lubricants, trace quantities of various explosives and rock fines. If mill water is used to convey tailings underground for use as backfill, the minewater may also carry traces of the various chemicals that are used in the milling of the ore. Minewater must be removed from the mine or the mine would flood.

Large quantities of water are normally used in the milling of Ontario ores. This water can come into contact with a variety of chemicals that are used to process the ore. This water, along with large quantities of finely divided waste rock (tailings), is directed to an impoundment area (tailings area). The solids settle out and remain in the tailings impoundment. Water that is not required for process activities is subjected to further treatment (if necessary) and then released to the environment.

Wastewaters generated by the Metal Mining Sector may be held for long periods of time before release to the environment. Retention times of six months to one year are common at large properties.

DESCRIPTION OF THE MONITORING PROGRAM

Monitoring data for the Metal Mining Sector were collected by the mining industry under Ontario Regulation 491/89 as amended to Ontario Regulation 44/90. Ontario Regulation 44/90 was filed with the Registrar of Regulations on January 26, 1990 and was published in the Ontario Gazette on February 10, 1990. Monitoring under this Regulation began on February 1, 1990 and was completed on January 31, 1991. Following this 12-month monitoring period, the industry was required to report to the Ministry of the Environment the results of all flow measurements and/or estimations and all chemical analyses required to be done on or after the 1st day of February, 1991 by an Approval given under Section 24 of the Ontario Water Resources Act within 90 days after making the measurement, estimation or analysis. This will continue until the promulgation of the Effluent Limits Regulation for the Metal Mining Sector.

Under the Metal Mining Effluent Monitoring Regulation, all effluents were placed into one of the following four categories:

(1) MINEWATER EFFLUENT

Underground and open pit mines may generate an effluent that is called "minewater effluent". In simple terms, minewater effluent is water that flows or is pumped from the mine workings. Water gains access to mine workings by percolating through surrounding rock, by its association with materials that may be required by the mining process itself and by its deliberate introduction into the mine for use in the mining process. To prevent the mine workings from flooding, this water must be removed from the mine. In some cases, this water is re-used in other processes and is not discharged directly to the environment. When re-use is not possible, this water is treated, if necessary, and then released to the environment.

(2) PROCESS EFFLUENT

Many mining operations generate large amounts of finely divided waste rock called "tailings". Tailings are routinely transported in the form of a slurry of solids and water to a storage area called a "tailings area". The solids settle in the tailings area while the associated liquid in the area is allowed to leave the area and forms an effluent that is known in the industry as a tailings area decant. In the Effluent Monitoring Regulation for the Metal Mining Sector, a tailings area decant is known as a "process effluent". A tailings area decant is treated, if necessary, before being discharged to the environment. In addition, a portion of the decant may be returned to the plant for re-use. The volume of a tailings area decant is normally directly related to the amount of water being used in processing at the plant and the amount of water being recycled. However, this volume is often augmented by natural precipitation gaining access to the tailings area and by any natural watercourses gaining access to the tailings area.

(3) SMEILTER/REFINERY EFFLUENT

Most smelters and refineries in the Metal Mining Sector discharge their wastes to a tailings area or to a treatment facility associated with a tailings area. Here, the smelter/refinery effluents become subject to recycle and all the other treatment strategies that a tailings area decant may undergo and exit the area as a "process effluent". As such, the smelter/refinery effluent category is reserved for those smelter/refinery effluents that are not discharged to a tailings area or associated treatment facilities but are discharged directly to the environment with treatment (if necessary).

(4) STORM WATER EFFLUENT

Storm water effluents in the Metal Mining Sector largely originate on inactive tailings areas that may cover hundreds of hectares. The effluent volumes are precipitation driven but can be augmented by natural sources of water such as springs and streams that may exist in the areas. Because of the large areas that are normally involved, storm water effluents in the Metal Mining Sector tend to be continuous effluents but this is not always so. Within the Metal Mining Sector Effluent Monitoring Regulation, storm water effluent is considered to be runoff from inactive tailings areas or from active plant areas such as parking lots and concentrate loading areas that is collected and, if necessary, treated before discharge to the environment. Storm water effluents should not include inputs of "process effluent", "smelter/refinery effluent" or "minewater effluent".

Unlike many other industrial sectors, cooling water effluents are only a minor component of Metal Mining Sector plant effluents. As such, cooling water effluents were not considered in the Metal Mining Sector Effluent Monitoring Regulation.

There were 69 sampling points listed in the Metal Mining Sector Effluent Monitoring Regulation as amended. However, due to factors such as the variable nature of operations within the industry, the number of sampling points at any one time during the monitoring period was closer to 50.

The total quantity of data collected during the 12-month monitoring period was as follows:

<u>Type of Effluent</u>	<u>Number of Data Points</u>
Smelter/Refinery Effluent	12,065
Minewater Effluent	18,367
Process Effluent	45,221
Storm Water Effluent	3,679
Quality Control	95,949
Ministry Audit	8,292

TOTAL	183,573

The cost to industry of the data collection under the Metal Mining Sector Effluent Limits Regulation was estimated to be in the range of 13 to 18 million dollars (Canadian).

The majority of samples taken under the Regulation were composite samples that consisted of 3 grab samples that were taken within an 8-hour period and then combined to form a composite sample. A large number of grab samples were also taken depending on the retention time of the wastes involved. A few samples taken were composite samples based on continuous sampling.

The frequency of sampling under the Metal Mining Sector Effluent Monitoring Regulation varied depending on factors such as the individual characteristics of the subsector or property involved. In general, however, sampling was carried out on a "three times per week", "monthly" and "quarterly" basis. Parameters that were placed in these categories, on a subsector or site-by-site basis, are as follows:

Three Times Per Week

pH, suspended solids, oil and grease, ammonia plus ammonium, total cyanide, weak acid dissociable cyanide, arsenic, copper, nickel, lead, zinc, iron

Monthly

chemical oxygen demand, total kjeldahl nitrogen, nitrate plus nitrite, ammonia plus ammonium, dissolved solids, phenolics (4AAP), sulphates, cyanates, thiocyanates, phosphorus, arsenic, cadmium, cobalt, mercury, iron, chromium, copper, lead, zinc, vanadium, uranium

Quarterly

a standard list (the sector list) of 150 parameters

An indication of the accuracy of the analytical procedures used during the monitoring period is given by the Regulation Method Detection Limit (RMDL). The RMDL for each parameter is given in Appendix 1 ("Comparison of Audit and Monitoring Data") and is found in the upper right hand corner on each specific parameter data sheet.

During the monitoring period, each direct discharger was required to measure or estimate the flow of each effluent stream at the time of sampling and at a location or set of locations representative of the flow at the sampling point. Methods, devices or calculations for the measurement or estimation of flow had to be capable of accuracy to within plus or minus 20 per cent of the actual flow.

Toxicity testing under the Metal Mining Sector Effluent Monitoring Regulation consisted of both the fish toxicity test (Rainbow Trout Acute Lethality Test) and the Daphnia magna Acute Lethality Test as outlined in the published protocols entitled:

- "Protocol to Determine the Acute Lethality of Liquid Effluents to Fish" and
- "Daphnia magna Acute Lethality Toxicity Test Protocol"

Both toxicity tests were run on a quarterly basis.

Quality assurance and quality control (QA/QC) include all of the procedures undertaken to ensure that data produced are within known probability limits of accuracy and precision. QA/QC was one of the most important aspects of the Metal Mining Sector monitoring program. 50 per cent of all data points generated were QA/QC data points. The QA/QC program included many small but essential activities ranging from proving the cleanliness of sample bottles; using proper sampling equipment, containers and preservatives; instrument calibration; validation of authenticity of standards; inclusion of blanks, spikes and controls in analytical runs; documenting performance; participation in external round-robins and defining a method for reporting a final data number. Omission of one of these activities can lead to unreliable data resulting in improper conclusions and perhaps inappropriate actions.

The Metal Mining Sector database is considered to accurately represent the general nature of effluents discharged by active properties within the Sector for the period February 1, 1990 to January 31, 1991. Sampling took place at all major plants within the Sector with the exception of a very small number of plants that

were in the process of termination of activities. Plants within the sample group accounted for more than 95 per cent of mine production within the Sector. In general, sampling was not carried out at properties that generated an effluent flow of less than 50,000 litres (approximately 11,000 gallons) per day.

Plants monitored within the Sector, in general, did not operate on a continuous basis throughout the monitoring period. In addition, many operating plants held wastes for varying lengths of time in order to make use of a waste treatment process termed "natural degradation". This has been a common practice within the industry for a number of years. There is no effluent discharge while wastes are being held. Appendix 2 of this report gives the total number of days of effluent discharge during the monitoring period at each plant sampled under the Metal Mining Sector Effluent Monitoring Regulation.

MONITORING DATA EVALUATION

All analytical data obtained under the Metal Mining Sector Effluent Monitoring Regulation for the period February 1, 1990 to January 31, 1991 is summarized in various forms in the Appendices of this report. These data summaries are as follows:

APPENDIX 1

Comparison of Audit and Monitoring Data

The initial two pages of Appendix 1 give the Sector List (all parameters sampled during the monitoring period) and an Index to the pages within Appendix 1 that contain the monitoring and audit results for each parameter. In general, sampling, analysis and reporting were the responsibility of industry. The Ministry of the Environment, however, did take one or two "audit" samples during the sampling period at many properties. This "audit" data is reported along with the industry "monitoring" data in Appendix 1. In Appendix 1, "N" means the "number of samples" and "RMDL" means the "Regulation Method Detection Limit". The meaning of the remark codes associated with the audit data in Appendix 1 are explained in Appendix 3 (Data Quality Evaluation Report).

APPENDIX 2

Number of Days of Effluent Discharge

Appendix 2 indicates the total number of days in each month during the monitoring period that wastes were discharged at each property. The data are effluent specific.

APPENDIX 3

Data Quality Evaluation Report (12-Month Database)

Appendix 3 describes the QA/QC procedures that were applied to the final Metal Mining Sector database. All remark codes, QA/QC procedures and results are explained in detail. Table 1 (page 3) gives the total list of parameters selected for consideration in the Metal Mining Sector prior to data quality evaluation. In all, 58 parameters were selected. Table 6 (page 12) gives the final list of parameters selected after data quality evaluation procedures had been applied. 42 parameters are found in the final list.

APPENDIX 4

Summary of Flow Data

Appendix 4 is a summary of all flow data generated during the monitoring period (February 1, 1990 to January 31, 1991). All flows are given in cubic meters per day and are effluent specific. In Appendix 4, "N" means the "number of samples" that the data are based on. "C.V." means "coefficient of variance" (standard deviation divided by the mean) and is expressed as a percentage.

APPENDIX 5

Long Term Average (LTA) Concentration and Loading Tables

Appendix 5 is a summary of the concentrations (LTA) and loadings (LTA) for all selected parameters at each plant site on an effluent specific basis. Loadings are expressed as "average (LTA) loading (kg/day)" and "annual loading (kg/year)". In Appendix 5, an asterisk (*) near a parameter name indicates a QA/QC problem with the parameter. The nature of the problem is given in Appendix 3. In addition, Appendix 5 gives the total number of days of effluent discharge at the specific property involved.

APPENDIX 6

Monthly Average Concentration Plots

The initial page of Appendix 6 lists all plants for which monthly average concentration plots were carried out. Each plant has an assigned plant number (left side of initial page). Plots for an individual plant and for all effluents monitored at that plant are found under the appropriate plant number (upper left-hand corner of each sheet of plots). Plots are given for 16 key parameters for each effluent stream sampled. The numbers that appear above each point of each individual plot indicate the number of samples that the point is based on. The letters appearing below each plot (example: F M A M J JY) represent the months of the sampling period beginning with F (February, 1990) and ending with J (January, 1991). Horizontal "reference lines" have been drawn on some of the plots. These lines are drawn for convenience only and represent levels that are of interest to the Ministry of the Environment.

APPENDIX 7

Daily Concentration Plots

In Appendix 7, daily concentration plots are given for 8 key parameters for each effluent stream sampled. As in Appendix 6, plant identification, stream identification and plant numbers are given at the top and upper left corner of each page of plots. In the Metal Mining Sector, "daily" samples were not taken each day. Instead, "daily" samples were taken, in general, on three days in each week. On a week-to-week basis, the sampling days at any particular property were not always the same days. In the plots themselves, the data points tend to appear in groups of three points (reflecting the three times per week sampling schedules). Points within the same group (samples taken the same week) are connected by straight lines in the plots to clarify groupings. The horizontal "reference lines" that appear on all plots are the same reference lines that were used in Appendix 6. These "reference lines" are drawn for convenience only and represent levels that are of interest to the Ministry of the Environment.

APPENDIX 8

Annual Loadings

Appendix 8 gives the total annual loadings (kg/year) for all selected parameters in the Metal Mining Sector. Total annual loadings are also given on a sub-sector basis and on an individual plant basis. With reference to Appendix 1, individual plants can be identified through their plant numbers and individual streams can be identified through their control point numbers.

All annual loadings given in Appendix 8 are based on the actual number of days of effluent discharge at each property in the sector. The number of days of effluent discharge at each property is given in Appendix 5.

APPENDIX 9

Listing of Dioxin and PCB Monitoring Data

Appendix 9 is a summary, for convenience, of all dioxin and PCB monitoring data generated under the Metal Mining Effluent Monitoring Regulation during the period February 1, 1990 to January 31, 1991. While this data is given in Appendix 1, Appendix 9 includes associated remark codes and comments.

APPENDIX 10

Acute Lethality Data for Ontario's Metal Mining Sector Effluents Covering the Period from February 1990 to January 1991

A report, with the above title, was produced by Westlake, Lee, Poirier, Abernethy and Mueller of the Aquatic Toxicity Unit of the Water Resources Branch of the Ontario Ministry of the Environment (April 1992). The "Summary" of the report is given in Appendix 10.

APPENDIX 11

Provincial Water Quality Objectives and Guidelines

Table 1 in the current edition of the Ontario Ministry of the Environment publication "Water Management" (revised May, 1984) lists the Provincial Water Quality Objectives and Guidelines that were available at that time. Since then, a number of additional Provincial Water Quality Objectives and Guidelines have been developed. The current version of Table 1 (July 1991) forms Appendix 11. In Appendix 11, PWQO means Provincial Water Quality Objective; PWQG means Provincial Water Quality Guideline and the word "Proposed" indicates that the candidate Objective or Guideline is currently undergoing external peer review and has not yet been approved by the Ministry of the Environment and could be revised.

APPENDIX E	Non-selected Parameters with Under-recovery for Travelling Spiked Blanks

1. INTRODUCTION

As part of the Ontario Ministry of the Environment's Municipal Industrial Strategy for Abatement (MISA) program forty-six Ontario metal mining companies conducted one year of effluent monitoring (1,2). The analytical data set obtained from the 12-month monitoring period is being used by the Ministry of the Environment to select a list of parameters for effluent limit setting. Limits are being set for those parameters which are found in a company's effluent, have acceptable quality assurance and quality control (QA/QC), and are determined to be treatable by Best Available Technology Economically Achievable (BATEA). Parameters which have unacceptable data or for which BATEA is not identified may be subject to continued monitoring.

1.1 Data Quality

The data obtained from the monitoring period must be of known reliable quality to be used in the limit setting process. To document the quality of the monitoring data, mining companies were required to submit quality assurance and quality control (QA/QC) data. The reporting of QC data assists in evaluating the impact of field and laboratory activities on the validity of the data reported.

The primary data quality concerns include the possibility that:

- . low results represent false positive findings,
- . non-detected results represent false negative findings,
- . results are underestimated or overestimated,
- . analytes are misidentified.

In addition to QC data, each individual test result may be qualified by the analyst using a remark code to attest to the degree of confidence in the quality or absolute value of a result.

Monitoring for the Metal Mining Sector was completed on 91/01/31. This report completes the quality assessment of the final monitoring database.

The quality of the data compiled is determined through an evaluation of the remark codes that may be associated with individual test results and by the QC data collected. Based on this assessment, parameters may be excluded from further consideration in limit setting.

The data quality evaluation emphasizes those parameters preliminarily selected as candidates for limit-setting.

2. Parameters for Effluent Limit-Setting

2.1 Criteria for Selection of Parameters for Limit-Setting

Data for each plant's effluent streams are evaluated by firstly listing those substances monitored and found at a frequency great enough to warrant consideration for limit setting (3). A parameter is listed for further consideration unless 90% of the analytical results are "not detected". This is accomplished statistically, at the 95% confidence level, using a binomial test if there are more than twenty samples and the table by Conover for sample numbers ≤ 20 . An analytical result is treated as "not detected" if the result reported is less than the regulation method detection limit (RMDL) or equal to the RMDL with an associated remark code of <W, <DL, <T, < or <WE.

2.2 Preliminary List of Parameters

Based on the selection criteria, and prior to any evaluation of data quality, a total of 58 parameters were selected as initial candidates in limit setting for the Metal Mining Sector. The parameters selected are given in Table 1 along with the total number of streams for which each parameter was selected. In Appendix C the list of selected parameters is further broken down into a list for each effluent stream and also for the Mining subcategories:

- . Copper, Lead, Zinc, Nickel;
- . Gold;
- . Iron;
- . Uranium.

A list of the companies and stream identifications is also given in Appendix C.

4b	Nitrate + Nitrite	45
5b	TOC, Total Organic Carbon	17
M1	Chlorides	40
M2	Cyanates, Filtered	2
M3	Dissolved Solids	50
M4	Sulphates	43
M5	Iron	50
M6	Thiocyanates, Filtered	12
M7	Uranium	11
M8	Cyanide (Free)	18

TABLE 2

Processing of Data by Remark Code

The remark codes listed below were used in the MISA Mining Sector 12 month database to qualify the data reported. Data associated with these remark codes were managed as follows.

1. For the following eleven remark codes;

< Actual amount less than reported
 <DL Reported value = MDL: measured amt. MDL (non-zero)
 <T A measurable trace amount: interpret with caution
 <W No measurable response (zero): reported value
 <WE No measurable response (diln/conc): reported value
 A Approximate value
 AIS Approximate value: insufficient sample
 I Interference suspected
 IM Interference: sample matrix
 IB Interference: background
 OLD Old: sample exceeds maximum storage time

- . If the concentration reported was less than RMDL/10 or equal to zero then RMDL/10 was substituted.
 - . Other results used as reported.
-

2. For the following six remark codes;

? Late data: data not yet available: see text
 N/A No data will be reported
 !IN No data: insufficient volume due to inspection
 !NM No effluent - no sample available
 AR Attached report
 Blank ie. No remark code entered

- . All zero results were excluded.
 - . If the concentration reported was less-than RMDL/10 and greater-than zero then RMDL/10 was substituted.
 - . Other results used as reported.
-

3. Data with the following three remark codes was excluded;

SIP Sample improperly preserved
 UCR Data unreliable: could not confirm by reanalysis
 UQC Data unreliable: possible lab QC problem(s)

3. Data Quality Assessment

3.1 Evaluation of Data by Remark Code

Table 2 lists the remark codes which were used in the Metal Mining Sector database to qualify individual results reported. The results reported with these remark codes were reviewed in comparison to the other results for a parameter to decide what data should be excluded. Based on this review, all data with the remark codes SIP, UCR or UQC were excluded from further evaluation because the results were questionable. All other data was included in the QA/QC assessment process. Data with analytical results below the RMDL were used as reported unless the result was less than RMDL/10. In this case, the value of RMDL/10 was substituted.

Based on the selection criteria, a parameter may be preliminarily selected at a stream because of results which did not meet the RMDL. These results are identified by a value greater than the RMDL and an associated "less-than" remark code of <W, <DL, <T, < or <WE. It is convenient to consider these results in two ways based on the level of non-compliance with the RMDL and the reason behind it.

1. Results may be reported above the RMDL because a laboratory detection limit (LMDL) is greater than the regulation method detection limit (RMDL). For individual results reported with a "less-than" remark code, but within 1.6 times the RMDL, the absence of an analyte may be accepted because the result is not significantly greater than the RMDL. In the absence of other positively detected samples, a parameter may be removed from the list of parameters selected for a stream. "Less-than" data reported above 1.6 times the RMDL should not be used to confirm the presence or absence of an analyte.

Table 4 (page 10) lists those streams for which parameters were selected based on "less-than" results reported above the RMDL but where results were within 1.6 times the RMDL. These streams may be removed from the list of streams selected for a parameter. Monitoring for assessment may be required.

2. Due to the nature of an effluent sample there may be potential for interference in the analytical method; therefore, not every analyte will be observable in every sample down to the RMDL. There will be cases when no reportable or observable result is available at levels far above the RMDL. If remark codes are properly applied, these values are identified by the < or <WE remark code. When reported at levels greater than 1.6 times the RMDL these results should not be used to confirm the presence or absence of an analyte. In the absence of other positively detected/not-detected results then the parameters data are unacceptable and further monitoring may be required.

Table 5 (page 11) lists those parameters and streams selected because of data reported above 1.6 times the RMDL with an associated "less-than" remark code (<W, <DL, <T, <, <WE).

3.2 Evaluation of Data by QA/QC Results

The evaluation of monitoring data quality, using the results of reported QC data, follows the approach outlined in the draft MISA Issues Resolution Process - Issue Resolution Committee Reports (Ontario Ministry of the Environment, 1990).

3.2.1 QC Data Reporting Requirements

The effluent monitoring regulation for the Metal Mining Sector required the reporting of the following QC results (1);

- . travelling blanks,
- . travelling spiked blanks,
- . laboratory method blanks.

Each of the QA/QC data types provides information about the quality of the effluent samples.

Travelling blanks provide information on any problems with sample contamination. Travelling blank results are expected to be less than the laboratory detection limit (LMDL) unless field operations are introducing contamination. Travelling blanks were not required for analytical test groups (ATG's) 1, 3, 8, 28 and 29.

The primary function of travelling spiked blanks is to provide information on loss or degradation of analyte from the time of sampling to analysis. Travelling spikes are required only for analytical test groups 16 to 20, 23 and 27. A comparison against the laboratory spiked method blank may help to determine whether the sample has deteriorated or whether it is a laboratory recovery or control problem.

Laboratory method blanks are used to correct for labware/reagent contamination. The reporting of both uncorrected and corrected monitoring results indicates if a laboratory is correcting for laboratory blanks and also aids in assessing the magnitude of the effect of laboratory operations on the effluent data. Failure to properly correct monitoring results for laboratory blanks may lead to:

- . false positives or overestimates (lack of correction);
- . false negatives or underestimates (over-correction).

Data for other laboratory QA/QC checks such as spiked blanks and replicates used for assessing recovery and precision and which are required under the MISA general effluent monitoring regulation are not reported but retained on file by the laboratories for possible audit/review by the Ministry (2).

3.2.2 Presentation of Data for Quality Assessment

Appendix B contains tables summarizing effluent monitoring and any accompanying QC data for each parameter on the initial list of selected parameters. Data is presented only for those streams at which the parameter was selected.

All monitoring and travelling blank data are presented as concentration ratios. A concentration ratio is the analytical result divided by the RMDL for the parameter.

Laboratory corrections are presented as difference ratios, defined as the difference between the uncorrected and corrected monitoring data divided by the RMDL for the parameter.

The data tables serve as a screening tool for the quality of the data. Scaling results against the RMDL provides an immediate indication of the significance of a result. For example, a concentration ratio of 1.0 would indicate that the reported result was equal to the RMDL. Concentration ratios for travelling blanks which are always less than or equal to 1.0 would indicate that field contamination was not significant. Travelling blank concentration ratios greater than 1.0 would be compared to the monitoring concentration ratios and, if significant, a more detailed investigation would be carried out.

Difference ratios of zero for laboratory corrections indicate that the laboratory is not correcting for lab blanks. When laboratory corrections are made, they should be stable and less than the monitoring concentrations.

Minimum, median, maximum and average concentration/difference ratios are presented for each stream where a parameter was selected.

Travelling spiked blank data is presented as minimum, median, maximum and average spike recoveries. Also presented is the average quantity spiked divided by the RMDL.

The data tables also classify monitoring data for the selected parameters according to their frequency and level of detection in each effluent stream.

Parameters are classified as:

FH	Frequently Found - High Level
FM	Frequently Found - Medium Level
FL	Frequently Found - Low Level
IH	Infrequent Found - High Level
IM	Infrequent Found - Medium Level
IL	Infrequent Found - Low Level

A full description of the frequency classification is given in Appendix D. The frequency of occurrence classification helps dictate the strategy and the predominant general QC concerns which must be evaluated. Flow charts for the evaluation of QC data are given at the back of Appendix D. These flow charts provide guidance for systematic evaluation of specific QC data.

3.2.3 Evaluation of Frequently Found Parameters

Effluent data were considered as being either an acceptable representation of actual levels, a possible under-estimate or a possible over-estimate of the actual level of a particular analyte. The likelihood of over-estimation is based on over-recovery of travelling spiked blanks and travelling blanks greater than the RMDL. The likelihood of under-estimation is based on under-recovery of travelling spiked blanks and high laboratory blanks. False positives become a concern for low level data (ie. FL).

3.2.4 Evaluation of Infrequently Found Parameters

Effluent data were considered as being either acceptable (true positive) or questionable (possible false positive). The likelihood of false positives is based on over-recovery of travelling spiked blank samples and/or contamination of travelling blank samples.

3.2.5 Evaluation of Non-Selected Parameters

Parameters not selected as candidates for limit setting are investigated for possible false negative results. The possibility of false negatives is based on gross under-recovery of travelling spiked blank samples (< 20%) and over correction for laboratory blanks. Parameters showing under-recovery are listed in Appendix E.

During the evaluation of the QC data, consideration was also given to the following:

- . Unique parameters (ie. parameters selected for only one site) were investigated for linkage to chemicals used at the site.
- . Parameters which are selected for a limited number of sites were investigated for linkages to use of the same laboratory and for use of chemicals on-site.

QC data for each of the selected parameters is discussed in Appendix A.

4.0 Conclusions:

Based on the evaluation of the QC data, the parameters listed in table 3 have monitoring data which are questionable and should be considered for removal from the list of parameters and for possible further monitoring.

TABLE 3

**Parameters with Data of Questionable Quality
Based on Evaluation of QA/QC Data**

Parameter	Company
Oil & Grease	5 - Noranda, Geco Division
Zinc	57 - Cameco, Refinery, Port Hope, SR 0100, SR 0200
	2 - INCO, Crean Hill Mine
	12 - Falconbridge, Kidd Creek Mine
Nickel	24 - Teck - Coronna, David Bell Mine
Phenolics	6 - Falconbridge, Kidd Creek Mine
Hexachloroethane	1 - INCO, Coper Cliff T.P.
	2 - INCO, Crean Hill Mine
	4 - INCO, Garson Mine
	7 - INCO, Levack Mine
	10 - INCO, Refinery, Sudbury
	11 - INCO, Nolin Creek T.P.
	13 - INCO, Refinery, Port Colborne
	14 - INCO, Shebandowan Mine
	16 - INCO, Whistle Mine
Chloroform	8 - Falconbridge, Lockerby
Trichlorofluoromethane	30 - Hemlo Gold Mines, Golden Giant

Note: "Less-than" Remark Codes are <, <DL, <W, <WE, <T

Based on remark codes associated with the monitoring data, tables 4 and 5 list those parameters and streams which should be considered for removal from the list of parameters selected for limit-setting. Parameters for these streams may require further monitoring.

APPENDIX A

Results of QA/QC Evaluation for Selected Parameters

Results of QA/QC Assessment for Selected Parameters

Dissolved Solids

RMDL = 20.0 mg/L

(Selected in 50 streams)

Average monitoring concentration ratios over the 50 selected streams range from 7.30 to 212.2 times the RMDL. Travelling blank data are available for 44 of these streams.

The highest average travelling blank concentration ratio of these streams is 1.10 RMDL. The maximum ratio is 2.30 RMDL. The travelling blank levels are not significant compared to the level of monitoring concentrations.

Conclusion: Data are acceptable.

Iron

RMDL = 0.02 mg/L

(Selected in 50 streams)

Average concentration ratios range from 2.3 to 293.7 times the RMDL over the 50 selected streams. Travelling blank data are available for 38 of these streams.

The highest average travelling blank concentrations are for Falconbridge, Onaping; however, only 2 travelling blanks results were reported (concentration ratios = 1.00 & 6.75) which provides insufficient information to assess the data. Falconbridge, Onaping also has the lowest monitoring sample concentrations of the 50 streams. The Onaping sample with the highest travelling blank concentration (ratio = 6.75) was reported on the same day as the highest monitoring concentration (ratio = 9.65); therefore, this result may be overestimated.

Canamax, Marhill Mine has the second highest travelling blank ratios but they are not significant compared to the monitoring concentrations.

Samples from three other Falconbridge sites (Lockerby, Strathcona, Kidd Creek) also show some travelling blank contamination but at levels always significantly less than monitoring samples. Lockerby and Strathcona each reported only 2 travelling blanks. Kidd Creek reported 4.

Travelling blanks from other streams are not significant compared to the level of monitoring concentrations.

Conclusion: Data are acceptable.

Ammonia plus Ammonium

RMDL = 0.25 mg/L

(Selected in 50 streams)

Average concentration ratios range from 0.71 to 219.5 times the RMDL over the streams selected. Travelling blank data are available for 42 of these streams.

Ammonia + Ammonium was not detected in more than 1 travelling blank at any stream. The highest travelling blank concentration (6.80 RMDL) at INCO, Nolin Creek is equal to the monitoring sample concentration on the same day; however the concentration ratios for the other 3 travelling blanks equal 0.44. The levels detected in travelling blanks from other streams are not significant compared to monitoring levels.

Conclusion: Data are acceptable.

Total Kjeldahl Nitrogen
(Selected in 48 streams)

RMDL = 0.5 mg/L

Average concentration ratios range from 1.13 to 100.1 times the RMDL over the 48 streams. Travelling blank data are available for 42 of these streams.

Kjeldahl nitrogen was not detected in more than 1 travelling blank from any stream. The highest travelling blank concentration ratio occurs at Minnova, Winston; however only 2 results were reported (ratios: 0.20 and 3.16 RMDL). The average monitoring concentration ratio is 5.83 RMDL.

Conclusion: Data are acceptable.

Nitrate + Nitrite
(Selected in 45 streams)

RMDL = 0.25 mg/L

Average concentration ratios range from 1.38 to 384.0 RMDL over the 45 streams. Travelling blank data are available for 41 streams.

Nitrate and Nitrite was detected above the RMDL (1.6 RMDL) in only one travelling blank sample over the 41 streams. This travelling blank is reported for Rio Algom, Pronto on 90/03/27; however, no monitoring sample is reported on that day.

Conclusion: Data are acceptable.

COD (Chemical Oxygen Demand)
(Selected in 43 streams)

RMDL = 10.0 mg/L

Average concentration ratios range from 1.03 to 18.71 times the RMDL. Reporting of QC data for COD was not a requirement of the monitoring regulation; however, travelling blank data are available for 14 of the selected streams.

COD was detected in only 2 travelling blanks and at very low level (maximum 1.5 RMDL).

Conclusion: Data are acceptable.

Oil and Grease
(Selected in 44 streams)

RMDL = 1.0 mg/L

The average concentration ratios for monitoring samples range from 1.14 to 29.45 times the RMDL. Travelling blank data are available for 37 streams.

INCO:

Oil and Grease was selected at 9 INCO sites because the RMDL was not met for all samples analyzed from 90/02/02 to approximately 90/11/05 (approximately 75% of the data). The INCO laboratory detection limit during this period was 1.10 mg/L (method HE250A). Since results reported by INCO with the <DL code are within 1.6 times the RMDL, these data can be accepted as evidence for the absence of oil and grease.

The maximum oil and grease concentration ratio for an INCO stream is 1.70 RMDL at Levack Mine; however, this is the only true positive from this effluent. The greatest number of true positives at an INCO property occurred at Whistle Mine (3 true positives out of 89 samples). Oil and Grease was not detected in any travelling blanks from INCO streams.

Conclusion: INCO streams can be removed from the list of those selected for oil and grease.

5 - Noranda Minerals, Geco Division:

142 monitoring samples were reported for oil and grease with a detection frequency of 42%, an average concentration ratio of 1.38 RMDL and a maximum ratio of 4.60 RMDL. The results for the 3 travelling blanks reported are given below along with the monitoring sample on the same day.

<u>Date</u>	<u>Monitoring</u>	<u>Travelling Blank</u>	<u>Units</u>
90/03/22	1.00	1.00	mg/L
90/06/20	3.00	3.00	mg/L
90/11/14	4.00	7.60	mg/L

Conclusion: Travelling blanks for Noranda indicate that overestimation of monitoring results is possible.

Other Streams:

Oil and grease was detected in only one other travelling blank sample (Falconbridge, Kidd Creek) over the 44 streams.

Conclusion: All INCO streams should be removed from the list selected for oil and grease. Data for oil and grease from Noranda, Geco are questionable due to some risk for overestimation. All other data are acceptable.

Sulphates

RMDL = 5.0 mg/L

(Selected in 43 streams)

Average concentration ratios over the selected streams range from 3.43 to 531.3 times the RMDL. Travelling blank data are available for all selected streams.

Sulphates were not detected in travelling blanks from any of the streams.

Conclusion: Data are acceptable.

Total Suspended Solids

RMDL = 5.0 mg/L

(Selected in 40 streams)

Reporting of QC data for total suspended solids was not a requirement of the monitoring regulation; however, some companies did report a limited amount of QC. Suspended solids were not detected in any of the travelling blanks reported.

Conclusion: Data are acceptable.

Chlorides

RMDL = 2.0 mg/L

(Selected in 40 streams)

Average concentration ratios range from 2.25 to 11,167 times the RMDL over the 40 selected streams. Travelling blank data are available for all selected streams.

Chlorides were detected in travelling blanks only at Cameco Refinery, Blind River but at very low levels (maximum = 1.25 RMDL), not significant compared to the level of the monitoring samples.

Conclusion: Data are acceptable.

Zinc

RMDL = 0.01 mg/L

(Selected in 42 streams)

Average concentration ratios for zinc range from 0.80 to 167.1 times the RMDL over the 42 selected streams. Travelling blank data are available for 35 of these streams.

57 - Cameco Refinery, Port Hope, SR 0100

9 monitoring samples were reported with a detection frequency of 44%, an average concentration ratio of 1.20 RMDL and a maximum ratio of 3.20 RMDL. The detection frequency in travelling blanks was 50%. The maximum travelling blank concentration ratio is 2.70, the average is 1.60 RMDL. Travelling blank concentrations and monitoring samples taken on the same day are given below.

<u>Date</u>	<u>Monitoring</u>	<u>Travelling Blank</u>	<u>Unit</u>
90/03/20	0.005	0.004 <DL	mg/L
90/06/19	0.016	0.008	mg/L
90/10/30	0.007	0.027	mg/L
90/10/22	0.008	0.024	mg/L

57 - Cameco Refinery, Port Hope, SR 0200

9 monitoring samples were reported with a detection frequency of 44%, an average concentration ratio of 1.00 RMDL and a maximum ratio of 1.90 RMDL.

Zinc was detected in 1 travelling blank out of 4 at a level of 3.3 RMDL.

Conclusion: The available travelling blank data for the 2 Cameco streams indicate possible overestimates for some results.

2 - INCO, Crean Hill Mine, MW 0100

157 monitoring samples were reported.

10 out of 11 consecutive results reported between 90/06/07 and 90/06/29 are entered as 6.00 mg/L with the <DL code. The lab MDL for zinc is 0.006 mg/L. It is likely that these results are entered in ug/L rather than mg/L. Reporting these questionable entries as 0.006 mg/L gives 22 samples detected, a maximum monitoring concentration ratio of 4.60 RMDL, an average ratio of 0.78 RMDL and a frequency of detection of 14%. If the questionable entries are omitted then 22 detected samples out of 147 will select zinc in this stream. If the entries in question are reported as 0.006 mg/L then zinc would not be selected for this stream. Travelling blank data show zinc detected (1.40 RMDL) in 1 sample out of 4.

Conclusion: Selection depends on interpretation of questionable entries. Overestimates are also possible.

12 - Falconbridge, Onaping

154 monitoring samples were reported with a 26% frequency of detection. The average monitoring concentration ratio (3.30 RMDL) is influenced largely by 1 high result (221 RMDL). Removing this result produces an average ratio of 1.88 RMDL and a maximum of 23.3 RMDL. Zinc was detected in 2 of the 3 travelling blanks reported at concentration ratios of 6.0 and 1.7 times the RMDL.

Conclusion: Erratic travelling blanks; overestimates are possible.

25 - Placer Dome, Detour Lake

157 monitoring samples were reported with a detection frequency of 23%, an average concentration ratio of 1.20 RMDL and a maximum ratio of 8.0 RMDL. Zinc was detected (2.0 RMDL) in 1 of 4 travelling blanks reported.

Conclusion: Data are acceptable.

Other streams:

Zinc was detected in travelling blanks at 5 other streams but the levels in travelling blanks are not significant compared to the levels found in monitoring samples.

Conclusion: Zinc data for Cameco Port Hope, INCO Crean Hill and Falconbridge, Onaping are questionable. All other data for zinc are acceptable.

Copper

RMDL = 0.01 mg/L

(Selected in 39 streams)

Average concentration ratios range from 0.90 to 49.4 over the 39 streams. Travelling blank data are available for 31 of these streams.

2 - INCO Crean Hill

157 monitoring samples were reported with a detection frequency of 21%, an average concentration ratio of 0.90 RMDL and a maximum ratio of 12.40 RMDL.

Copper was detected (1.80 RMDL) in 1 out of 4 travelling blanks reported.

Conclusion: Data are acceptable.

Other Streams:

Copper was detected in 1 travelling blank sample at 4 other streams however at levels not significant compared to the monitoring levels.

Conclusion: All copper data are acceptable.

Nickel

RMDL = 0.02 mg/L

(Selected in 36 streams)

Average concentration ratios range from 0.70 to 136.20 times the RMDL. Travelling blank data are available for 30 streams.

24 - Teck-Corona, David Bell Mine

110 monitoring samples were reported with a detection frequency of 92%. The average concentration ratio is 1.95 RMDL, the maximum is 4.75 RMDL. 4 travelling blanks were reported. Nickel was detected in 2, both at 2.0 RMDL. The average travelling blanks ratio is 1.50 RMDL.

Conclusion: Insufficient information. Some monitoring samples may be overestimated.

5 - Noranda Minerals, Geco Division

142 monitoring samples were reported with a detection frequency of 15%, an average concentration ratio of 0.80 RMDL and a maximum ratio of 3.00 RMDL. 8 monitoring results were reported as 0.04 mg/L with the <DL remark code. The RMDL is 0.02 mg/L. There are 12 true positives for this stream. Nickel was not detected in travelling blanks.

Conclusion: Selection of nickel for this stream depends on interpretation of entries at 2 RMDL with the <DL code.

Other Streams:

Nickel was detected in some travelling blanks from three other streams but at levels which are not significant compared to the monitoring concentrations.

Conclusion: Selection of nickel at Noranda Geco depends on treatment of results greater than RMDL entered with a <DL code. Data for Teck - Corona, David Bell Mine are questionable. All other data are acceptable.

Aluminum

RMDL = 0.03 mg/L

(Selected in 35 streams)

Average concentration ratios range from 1.17 to 115.33 times the RMDL over the 35 selected streams. Travelling blank data are available all selected streams.

6 - Falconbridge, Kidd Creek Mine

4 monitoring samples were reported with a detection frequency of 100%, an average concentration ratio of 3.93 RMDL and a maximum ratio of 7.87 RMDL. Aluminum was detected in all travelling blanks (4) with an average concentration ratio of 1.77 RMDL and a maximum of 2.37 RMDL. Monitoring samples on the same day as travelling blanks are given below. Travelling blank concentrations are less than monitoring concentrations in all cases.

<u>Date</u>	<u>Monitoring</u>	<u>Travelling Blank</u>	<u>Unit</u>
90/02/22	.044	.041	mg/L
90/06/07	.069	.039	mg/L
90/09/13	.122	.059	mg/L
90/11/07	.236	.071	mg/L

Conclusion: Monitoring results are possible overestimates; however, data are acceptable for presence of Aluminum.

Other Streams:

Aluminum was detected in travelling blanks from 5 other streams but at levels not significant compared to the levels of monitoring samples.

Conclusion: Data are acceptable.

Cyanide Total

RMDL = 0.005 mg/L

(Selected in 27 streams)

Average concentration ratios range from 1.20 to 574.6 times the RMDL over the selected streams. Travelling blank data are available for 21 streams.

Cyanide was detected in only 1 travelling blank sample over the 27 streams and at a level not significant compared to the level of monitoring samples.

Conclusion: Data are acceptable.

Phenolics (4AAP)

RMDL = 2.0 ug/L

(Selected in 28 streams)

Average concentration ratios over the selected streams range from 0.67 to 61.9 times the RMDL. Travelling blank data are available for 26 streams.

INCO

Phenolics (4AAP) were selected in 9 INCO streams. The average monitoring concentration ratios range from 1.17 to 12.0 times the RMDL over the 9 streams. For each INCO stream selected, 1 - 3 samples were reported at 3.00 ug/L (ie. 1.5 RMDL) with a <DL remark code (method HE140A). Since these results are within 1.6 times the RMDL they will be accepted as evidence for the absence of phenolics. Treating this data as not detected will result in excluding 2 INCO streams from those selected for phenolics (4AAP). They are:

- a) INCO, Garson Mine: 3 true positives out of 12 samples.
- b) INCO, Whistle Mine: 2 true positives out of 8 samples.

These 2 streams have the lowest average monitoring concentration ratios out of the 9 INCO streams selected (ie. 1.54 and 1.17 RMDL).

For each of the 9 INCO streams 1 - 2 travelling blanks were also reported at 1.5 times the RMDL with the <DL code. There are no true positives in any of the travelling blanks from INCO streams.

Conclusion: INCO, Garson Mine and INCO, Whistle Mine are candidates for removal from the streams selected for Phenolics (4AAP). Data for other INCO streams are acceptable.

19 - Dickenson, Arthur W. White Mine

Phenolics (4AAP) were detected in 2 out 4 travelling blanks but at levels not significant compared to the monitoring concentrations.

6 - Falconbridge, Kidd Creek Mine

11 monitoring samples were reported with a detection frequency of 73%, an average concentration ratio of 3.45 RMDL, a maximum ratio of 9.00 RMDL. The average concentration ratio for travelling blanks is 3.75 RMDL (4 samples). Results for monitoring samples on the same day as travelling blanks are given below.

<u>Date</u>	<u>Monitoring</u>	<u>Travelling Blank</u>	<u>Unit</u>
90/02/22	11.00	23.00	ug/L
90/06/07	7.00	2.00	ug/L
90/09/13	6.00	2.00 <DL	ug/L
90/11/17	2.00	3.00	ug/L

method = MN829A

Conclusion: Data are questionable. Some results may be overestimated.

9 - Falconbridge Metallurgical

12 monitoring samples were reported with a detection frequency of 83%, an average concentration ratio of 2.25 RMDL, a maximum ratio of 3.50 RMDL.

The average concentration ratio for travelling blanks is 1.75 RMDL (4 samples).

Results for monitoring samples on the same day as travelling blanks are given below.

<u>Date</u>	<u>Monitoring</u>	<u>Travelling Blank</u>	<u>Unit</u>
90/02/21	7.00	5.00	ug/L
90/06/0	6.00	5.00	ug/L
90/09/12	5.00	2.00 <DL	ug/L
90/11/06	4.00	2.00	ug/L

method = MN829A

Conclusion: Results may be overestimated. Data are acceptable for presence of phenolics.

15 - Falconbridge, Strathcona

11 monitoring samples were reported, the frequency of detection is 82%, the average concentration ratio is 4.50, the maximum ratio is 9.75 RMDL. The average concentration ratio for travelling blanks is 1.75 RMDL (3 samples). Results for monitoring samples on the same day as travelling blanks are given below.

<u>Date</u>	<u>Monitoring</u>	<u>Travelling Blank</u>	<u>Unit</u>
90/05/01	10.00	4.00	ug/L
90/08/21	3.50	4.50	ug/L
90/11/20	9.00	2.00 <DL	ug/L

method = KR201B

Conclusion: Data are acceptable for presence of phenolics.

Other Streams

Phenolics (4AAP) were also detected in travelling blanks from Falconbridge, Lockerby and Falconbridge, Onaping but at levels not significant compared to the level of monitoring samples. Phenolics (4AAP) were not detected in travelling blanks from any other streams.

Conclusion: INCO Whistle and Garson Mine can be removed from the streams selected for Phenolics (4AAP). Data from Falconbridge, Kidd Creek Mine are questionable. All other data are acceptable for the presence of Phenolics (4AAP).

Cobalt

RMDL = 0.02 mg/L

(Selected in 19 streams)

The average concentration ratio ranged from 1.00 to 7.55 times the RMDL over the 19 streams. Travelling blank data are available for 16 streams.

Cobalt was not detected above the RMDL in any travelling blanks samples.

Conclusion: Data are acceptable.

Total Organic Carbon

RMDL = 5.0 mg/L

(Selected in 17 streams)

The average concentration ratio ranged from 0.83 to 8.35 times the RMDL. Travelling blank data are available for 17 streams.

TOC was detected in only 1 travelling blank sample at a level equal to the RMDL.

Conclusion: Data are acceptable.

Cyanide (WAD)

RMDL = 0.005 mg/L

(Selected in 18 streams)

The average concentration ratio ranged from 0.80 to 432.8 times the RMDL. Travelling blank data are available for 12 streams.

Falconbridge

Selected at Falconbridge Kidd Creek Mine and Metallurgical Site because the RMDL was not met. All monitoring and travelling blank data from these two properties are reported as 0.02 mg/L (4.0 RMDL) with the <DL code.

42 - Renabie gold Mines

All travelling blank data are reported as 0.02 mg/L (4.0 RMDL) with the <DL code; however, the travelling blanks are not significant compared to the level of monitoring data (average concentration ratio = 432.8 RMDL).

Other Streams:

Free cyanide was not detected in any other travelling blanks reported.

Conclusion: Data from Falconbridge, Kidd Creek Mine and Falconbridge Metallurgical Site did not meet the RMDL; therefore, these data are unacceptable for the presence or absence of free cyanide. All other free cyanide data are acceptable.

Arsenic

RMDL = 0.005 mg/L

(Selected in 13 streams)

The average concentration ratio ranged from 1.00 to 220.20 times the RMDL over the 13 streams. Travelling blank data are available for 10 streams.

Arsenic was not detected in any travelling blanks.

Conclusion: Data are acceptable.

Phosphorus

RMDL = 0.1 mg/L

(Selected in 12 streams)

The average concentration ratio ranged from 0.80 to 7.20 times the RMDL over the 12 streams. Travelling blank data are available for 9 streams.

Phosphorus was detected in only 1 travelling blank sample at 1.8 RMDL over the data from all streams.

Conclusion: Data are acceptable.

Thiocyanates, Filtered

RMDL = 5.0 mg/L

(Selected in 12 streams)

The average concentration ratio ranged from 0.87 to 5.20 times the RMDL over the 12 streams. Travelling blank data are available for 11 streams.

INCO

Thiocyanates were selected in 9 INCO streams. 33 monitoring results were reported by INCO for these 9 streams. Thiocyanates were selected in all of these streams because the RMDL was not met. 31 of INCO samples are reported as 10.00 mg/L with the <DL remark code by method HE360A (2 samples by method ZE040A are reported as 1.40 mg/L)

Conclusion: INCO data for thiocyanates are unacceptable.

Other streams

Thiocyanates were selected in 3 other streams. All travelling blanks from these streams are less than the RMDL.

Conclusion: Data from INCO do not verify the absence or presence of thiocyanates. Data for other streams are acceptable.

Uranium

RMDL = 0.02 mg/L

(Selected in 11 streams)

The average concentration ratio ranged from 1.10 to 7.35 times the RMDL over the 11 streams. Travelling blanks are available for 9 streams.

Uranium was not detected in any travelling blanks over the 11 streams.

Conclusion: Data are acceptable.

Lead

RMDL = 0.03 mg/L

(Selected in 10 streams)

The average concentration ratio ranged from 0.73 to 1.50 times the RMDL over the 10 streams. Travelling blank data are available for 9 streams.

Lead was not detected in travelling blanks from any of the selected streams.

Conclusion: Data are acceptable.

Cadmium

RMDL = 0.002 mg/L

(Selected in 10 streams)

Average concentration ratios range from 1.00 to 8.00 times the RMDL over the 10 selected streams. Travelling blank data are available for 9 of these streams.

9 - Falconbridge, Metallurgical

12 monitoring samples were reported with a detection frequency of 100%, an average concentration ratio of 8.0 RMDL, a maximum of 32.0 RMDL. There were 8 true positives. Four monitoring samples were reported as 0.003 mg/L (1.5 RMDL) with the <DL code (method MN821B). All travelling blank data was reported with the <DL code, three results at 0.003 mg/L (1.5 RMDL) and one at 0.002 mg/L.

Conclusion: Data are acceptable.

6 - Falconbridge, Kidd Creek Mine

12 monitoring samples were reported with a detection frequency of 83%, an average concentration ratio of 4.0 RMDL, a maximum ratio of 24.5 RMDL. Four consecutive samples were reported as 0.003 mg/L (1.5 RMDL) with the <DL code (method MN821B). There were 6 true positives. All travelling blank data was reported with the <DL code, three results at 0.003 mg/L and one at 0.002 mg/L.

Conclusion: Data are acceptable.

53 - Rio Algom, Panel

12 monitoring samples were reported with a detection frequency of 42%, an average concentration ratio of 4.50 RMDL, a maximum of 10.0 RMDL. The RMDL was not met for the first five samples of the monitoring period which were reported as 0.02 mg/L (10 RMDL) with the <DL remark code (method UQ018A). All further samples (7) were reported as 0.001 mg/L (.5 RMDL, method ZE001A). Cadmium was not detected in any of 4 travelling blanks. All are reported as 0.001 mg/L (0.5 RMDL) with the <DL remark code (method ZE001A).

Conclusion: Data should be accepted for the absence of cadmium.

54 - Rio Algom, Pronto

3 monitoring samples were reported. The first two results in the monitoring period did not meet the RMDL and were reported as 0.02 mg/L (10 RMDL) with the <DL remark code (method UQ018A). The final result was reported as 0.001 mg/L <DL (method ZE001A). All travelling blanks (3) were reported as 0.001 mg/L (0.5 RMDL) with the <DL remark code (method ZE001A).

Conclusion: The RMDL was not met. Data are unacceptable.

55 - Rio Algom, Quirke

12 monitoring samples were reported with a detection frequency of 42%, an average concentration ratio of 4.50 RMDL and a maximum ratio of 10.0 RMDL. The first 5 samples for the monitoring period did not meet the RMDL and were reported as 0.02 mg/L (10 RMDL) with the <DL remark code. All further samples (7) were reported as 0.001 mg/L (method ZE001A).

Cadmium was not detected in any of 4 travelling blanks. All were reported as 0.001 mg/L (0.5 RMDL) with the <DL remark code (method ZE001A).

Conclusion: Data should be accepted for the absence of cadmium.

58 - Rio Algom, Stanleigh

12 monitoring samples were reported with a detection frequency of 42%, an average concentration ratio of 4.5 RMDL, a maximum of 10.0 RMDL. The first 5 samples for the monitoring period were reported as 0.02 mg/L (10 RMDL) with the <DL remark code. All further samples (7) are reported as 0.001 mg/L (method ZE001A). Cadmium was not detected in any of 4 travelling blanks. All are reported as 0.001 mg/L (0.5 RMDL) with the <DL remark code (method ZE001A).

Conclusion: Data should be accepted for the absence of cadmium.

Other Streams: Cadmium was not detected in travelling blanks from other selected streams.

Conclusion: Rio Algom (Quirke, Panel and Stanleigh) should be removed from the list of streams selected for cadmium. Data from Rio Algom, Pronto are unacceptable. All other data are acceptable.

Hexachloroethane

RMDL = 0.01 ug/L

(Selected in 10 streams)

Average concentration ratios range from 3.80 to 434.30 times the RMDL over the 10 streams.

Nine of these streams are from Inco properties; the 10th stream is from Cameco, Blind River.

INCO

The average concentration ratios for the INCO properties range from 1.6 to 7.7 X RMDL. Pooling all of the INCO data gives an average concentration ratio of 4.6 RMDL (34 monitoring samples). The average concentration ratio for travelling blanks over the 9 INCO sites is 2.3 RMDL; 49% of the INCO monitoring ratio.

Maximum recoveries for travelling spiked blanks ranged from 124 to 335% for the INCO streams. The average recovery of travelling spiked blanks for all INCO data is 153%. The quantity spiked was identical for all samples (3.7 X RMDL). Laboratory blank corrections were not applied.

Conclusion: Due to over recovery of travelling spiked blanks and high levels in travelling blanks the presence of hexachloroethane in effluents cannot be verified from the field QC data. Since hexachloroethane was detected at all INCO sites and all have the same method code (HE203A) a laboratory problem is possible.

Cameco, Blind River

All monitoring data for Cameco, Blind River are qualified by the < remark code (method = ZE535A). Hexachloroethane was not detected in any travelling blanks. Travelling spiked blank recoveries ranged 73 - 120%. No corrections were applied for laboratory blanks.

Conclusion: All monitoring data are qualified by a < code; therefore, these data cannot be used as evidence for presence or absence of hexachloroethane.

Conclusion: The presence of hexachloroethane cannot be confirmed in any of the selected streams. Possible laboratory difficulties at both INCO and Cameco (Zenon) should be investigated.

1,1 - Dichloroethane

RMDL = 0.8 ug/L

(Selected in 7 streams)

The average concentration ratios range from 1.00 to 1.53 times the RMDL over the 7 streams. All of these are INCO streams.

INCO

1,1 - Dichloroethane was selected in all streams because the RMDL was not met. Except for one sample (concentration ratio = 2.75 RMDL) at the INCO Copper Cliff Treatment Plant all monitoring data is qualified by the <DL remark code. The INCO lab detection limit is reported as 0.90 ug/L (1.12 X RMDL). 1,1 - Dichloroethane was detected in only one travelling blank sample (1.62 RMDL); all other travelling blank results are qualified by the <DL remark code.

Recoveries for travelling spiked blanks ranged from 95 to 131 % over the 7 streams.

Laboratory blank corrections were not applied.

Conclusion: Since INCO's method detection limit is less than 1.6 X RMDL and travelling spike recoveries are acceptable the data should be accepted for the absence of 1,1 - Dichloroethane at levels significant compared to the RMDL. 1,1 - Dichloroethane should be removed from the list of selected parameters.

Molybdenum

RMDL = 0.02 mg/L

(Selected in 7 streams)

The average concentration ratio ranged from 1.50 to 28.50 over the selected streams.

24 - Teck-Corona, David Bell Mine

4 monitoring samples were reported with a detection frequency 100%, a minimum concentration ratio of 4.0 RMDL, a maximum of 12.0 RMDL. Molybdenum was detected in one travelling blank out of 4 and at high level (50.0 RMDL).

Conclusion: Infrequent contamination of travelling blank. Data should be accepted for presence of molybdenum.

Other streams

Molybdenum was not detected in travelling blanks from any of the other streams.

Conclusion: Data are acceptable.

Mercury

RMDL = 0.0001 mg/L

(Selected in 7 streams)

Average concentration ratios range from 1.21 to 27.80 times the RMDL. Travelling blank data are available for 5 of these streams.

42 - Renabie Gold Mines

8 monitoring samples were reported with a detection frequency of 100%, an average concentration ratio of 4.41 RMDL, maximum of 20.0 RMDL. The RMDL was not met for 3 monitoring results reported at 2 RMDL with the <DL remark code; therefore, there are actually 5 true positives. All travelling blanks (3) are reported at 2 RMDL with the <DL remark code. Conclusion: Data are acceptable.

27 - Placer Dome, Dona Lake Mine

5 monitoring samples were reported with a detection frequency of 80%. The average concentration ratio is 3.0 RMDL, the maximum ratio is 4.0 RMDL. Only one travelling blank was reported (concentration ratio = 2.0 RMDL).

Conclusion: Insufficient travelling blank information; therefore, data must be accepted as reliable.

Other Streams

Mercury was not detected in any travelling blanks from other streams.

Conclusion: Data are acceptable.

Antimony

RMDL = 0.005 mg/L

(Selected in 5 streams)

The average concentration ratios range from 1.80 to 115.20 times the RMDL.

27 - Placer Dome, Dona Lake Mine

Antimony was selected in this stream because the RMDL was not met.

All monitoring and travelling blank results were reported as 0.009 mg/L with the <DL code. The lab MDL was not within 1.6 times the RMDL; therefore, neither the presence or absence of antimony can be confirmed.

Conclusion: The data are unacceptable.

Other Streams: Antimony was not detected in any travelling blanks from other streams.

Conclusion: Antimony data from Placer Dome, Dona Lake Mine are unacceptable. All other data are acceptable.

Selenium

RMDL = 0.005 mg/L

(Selected in 5 streams)

The average concentration ratio ranged from 1.60 to 34.40 times the RMDL over the 5 streams. Travelling blank data are available for all 5 streams.

Selenium was not detected in any travelling blanks.

Conclusion: Data are acceptable.

Chloroform

RMDL = 0.7 ug/L

(Selected in 3 streams)

The average concentration ratios range from 1.86 to 26.43 times the RMDL over the 3 streams.

56 - Cameco Refinery, Blind River

Four monitoring samples for chloroform were reported. 2 high level results (44.3 & 54.3 RMDL) are qualified by the < remark code. Chloroform was detected in the other 2 monitoring samples at 2.86 and 4.29 RMDL.

Chloroform was not detected in travelling blanks and recoveries from 4 travelling spiked blanks are excellent (range: 95 - 100%).

Laboratory blank corrections were applied and are acceptable.

Conclusion: Two data points with the < code must be excluded; however, the other 2 samples are reliable for the presence of chloroform. Data are acceptable.

10 - INCO Refinery, Sudbury

Chloroform was detected in 3 out of four monitoring samples at levels of 3.0, 3.0 and 1.29 times the RMDL; not detected in any of 4 travelling blanks and recoveries from travelling spiked blanks were excellent (range: 90 - 100%). Laboratory corrections were not applied.

Conclusion: Data are acceptable.

8 - Falconbridge, Lockerby

4 monitoring samples for chloroform were reported; one sample (16.1 RMDL) was qualified by the UQC remark code and therefore excluded. Chloroform was detected in 2 of the other three samples at 2.57 and 2.0 X RMDL. 4 travelling blanks were reported. One travelling blank was excluded due to the UQC remark code; chloroform was detected in 1 of the other three travelling blanks at a level of 3.43 X RMDL. Travelling spike blank recoveries are 97.5, 98.5 and 158.94 for the three results reported. The sample with 158.94% recovery occurs on the same day as other monitoring and travelling blank samples were qualified by the UQC remark code. One large laboratory correction of travelling spiked blanks (10.54 RMDL) was also reported on this day. Lab corrections were not applied to other results. Conclusion: The data are questionable.

Conclusion: Data for Falconbridge, Lockerby are questionable. All other data are acceptable.

Benzene
(Selected in 2 streams)

RMDL = 0.5 ug/L

35 - Canamax, Marhill Mine

Benzene was detected in 3 of 4 monitoring samples at 3.76, 7.20 and 8.8 RMDL and detected in 1 of three travelling blanks samples at 37.4 RMDL. Three results for travelling spiked blanks were reported with recoveries of 17.7, 166.7 and 58.7%. The contaminated travelling blank was analyzed on the same day as the travelling spike with over-recovery. QC samples on the other two days are acceptable. Laboratory corrections are acceptable for all monitoring samples, travelling blanks and travelling spiked blanks.

Conclusion: Data are acceptable for the presence of benzene.

56 - Cameco Refinery, Blind River

Four monitoring samples for benzene were reported; 1 high level result (48.0 RMDL) was qualified by the < remark code.

Benzene was detected at high levels (440.0 and 16.0 RMDL) in 2 of the other three samples. Laboratory blank corrections were significant but less than the monitoring concentrations for both of the high level results. The maximum travelling blank concentration ratio is 0.40 RMDL; however, laboratory corrections were significant for 2 travelling blanks (average difference ratio = 2.98 RMDL). Recoveries from travelling spiked blanks were excellent (range: 85.0 -105.0%).

Laboratory corrections of travelling spiked blanks were acceptable compared to the analyte levels.

Conclusion: Data are acceptable.

Conclusion: All data are acceptable.

Toluene
(Selected in 2 streams)

RMDL = 0.5 ug/L

1 - INCO, Copper Cliff Treatment Plant

Toluene was detected in 3 of 4 monitoring samples at a maximum level of 5.68 times the RMDL (average ratio = 2.96 RMDL) and detected in 1 of 4 travelling blanks at 1.78 RMDL on the same day as the maximum monitoring concentration. Recoveries from travelling spiked blanks were acceptable (range: 87.5 -109.5%). Laboratory corrections were applied and are acceptable.

Conclusion: Data are acceptable.

5 - Noranda Minerals, Geco Division

Toluene was detected in 4 of 4 monitoring samples with a maximum concentration ratio of 2.80 RMDL, and average concentration ratio of 2.30 RMDL.

Toluene was not detected in travelling blanks (maximum concentration ratio = 0.40 RMDL) All recoveries from travelling spikes were acceptable (range: 102.0 - 124.0%). Laboratory corrections were not applied.

Conclusion: Data are acceptable.

Conclusion: Data are acceptable.

Unique Parameters (ie. selected in only 1 stream)

Thallium

RMDL = 0.03 mg/L

Selected at 27 - Placer Dome, Dona Lake Mine

Thallium was selected because the RMDL was not met. 2 monitoring samples and 1 travelling blank were reported. All were reported as 0.0330 mg/L with the <DL remark code. The reported results are within 1.6 times the RMDL; therefore, the data should be interpreted as not detected.

Conclusion: Remove thallium from the list of selected parameters.

Chromium

RMDL = 0.02 mg/L

Selected at 12 - Falconbridge, Onaping

Chromium was detected in 3 of 4 monitoring samples with an average concentration ratio of 2.25 RMDL, a maximum of 4.50 RMDL.

Chromium was not detected above the RMDL in any of 4 travelling blanks.

Conclusion: Data are acceptable.

Vanadium

RMDL = 0.03 mg/L

Selected at 37 - Bond Gold, Muskegsagagen Lake

Vanadium was selected because the RMDL was not met. 4 monitoring samples were reported, all equal to 0.050 mg/L (1.67 RMDL) with the <DL code. 4 travelling blanks were reported; 2 as 0.050 with the <DL code and 2 as 0.50 with the < remark code. Given that vanadium is a unique parameter, and no true positives are reported above 1.67 RMDL, it should be removed from the list of parameters.

Conclusion: Remove vanadium from the list of selected parameters.

Carbon tetrachloride

RMDL = 1.3 ug/L

Selected at 53 - Rio Algom, Panel

4 monitoring samples were reported with a detection frequency of 75%, and average concentration ratio of 17.87 RMDL, a maximum of 58.46 RMDL. Carbon tetrachloride was not detected in any of 4 travelling blanks.

Travelling spiked blank recoveries ranged from 85.0 to 110.0%

Conclusion: Data are acceptable.

Methylene chloride

RMDL = 1.3 ug/L

Selected at 35 - Canamax, Marhill Mine

Methylene chloride was detected in 3 of 4 monitoring samples with an average concentration ratio of 13.72 RMDL, a maximum of 45.38 RMDL. Methylene chloride was detected in 1 of 3 travelling blanks at 23.1 RMDL on the same day as the maximum monitoring samples concentration.

Recovery from one travelling spiked blank was high (193.7%). Recoveries for the other two travelling spikes reported were acceptable (58.3 and 76.2%).
Lab corrections were applied and are acceptable.

Conclusion: Data are acceptable.

Trichlorofluoromethane

RMDL = 1.0 ug/L

Selected at 30 - Hemlo Gold Mines, Golden Giant

2 monitoring results were reported with concentration ratios of 1.2 and 1.6 times the RMDL. Concentration ratios for the 2 travelling blanks reported are 0.10 and 1.0 times the RMDL. Travelling spiked blank recoveries are 182.0 and 78.0 %. Laboratory corrections were not applied.

Conclusion: Insufficient information to assess data.

o - Xylene

RMDL = 0.5 ug/L

Selected at 5 - Noranda Minerals, Geco Division

4 monitoring samples were reported with a detection frequency of 100%, an average concentration ratio of 7.90 RMDL, a maximum of 11.0 RMDL.
4 travelling blanks were reported; all less than the RMDL.

Recoveries for 4 travelling spiked blanks ranged from 106.7 to 120.0%.
Laboratory corrections were not applied.

Conclusion: Data are acceptable.

m - Xylene and p - Xylene

RMDL = 1.1 ug/L

Selected at 5 - Noranda Minerals, Geco Division

4 monitoring samples were reported with detection frequency of 100%, an average concentration ratio of 6.45 RMDL, maximum of 9.09 RMDL.

4 travelling blanks were reported; three at less than the RMDL and 1 result at 1.09 RMDL.

Recoveries for 4 travelling spiked blanks ranged from 100.0 to 113.3%.
Laboratory corrections were not applied.

Conclusion: Data are acceptable.

Naphthalene

RMDL = 1.6 ug/L

Selected at 5 - Noranda Minerals, Geco Division

4 monitoring samples were reported with a detection frequency of 100% an average concentration ratio of 1.94 RMDL, a maximum of 3.12 RMDL.

4 travelling blanks were reported; all less than the RMDL.

Recoveries for 4 travelling spiked blanks ranged from 72.0 to 79.2%

Laboratory corrections were not applied.

Conclusion: Data are acceptable.**2 - Methylnaphthalene**

RMDL = 2.2 ug/L

Selected at 5 - Noranda Minerals, Geco Division

4 monitoring samples were reported with a detection frequency of 100% an average concentration ratio of 1.78 RMDL and a maximum of 3.18 RMDL. 4 travelling blanks were

reported; all are less than the RMDL. Recoveries for 4 travelling spiked blanks ranged from 60.0 to 82.6%. Laboratory corrections were not applied.

Conclusion: Data are acceptable.**m - Cresol**

RMDL = 3.4 ug/L

Selected at 39 - Giant Yellowknife, Pamour #1

m-Cresol was detected in 3 of 4 monitoring samples with a maximum concentration ratio of 4.88 RMDL and an average ratio of 2.99 RMDL.

4 travelling blanks were reported; all are less than the RMDL.

Recoveries for 4 travelling spiked blanks ranged from 65.1 to 77.1 %

No lab corrections were applied.

Conclusion: Data appears acceptable; however, all results for m - Cresol are identical to those of p - Cresol.**p - Cresol**

RMDL = 3.5 ug/L

Selected at 39 - Giant Yellowknife, Pamour #1

All results reported for p - Cresol are identical to those for m - Cresol given above.

Conclusion: Investigate at laboratory.

Unique Parameters Selected at Company 56 - Cameco, Blind River

The following list of parameters were selected only at
56 - Cameco, Blind River

2,4,5 - Trichlorotoluene
Hexachlorobenzene
Pentachlorobenzene
1,2,3 - Trichlorobenzene
1,2,3,4 - Tetrachlorobenzene
1,2,3,5 - Tetrachlorobenzene
1,2,4 - Trichlorobenzene
1,2,4,5 - Tetrachlorobenzene
Octachlorostyrene
Hexachlorobutadiene
Hexachlorocyclopentadiene

4 monitoring samples were reported for each of these parameters. For each of these parameters 1 result was qualified by the <DL remark code and three results with the < remark code. The data do not verify the presence or absence of these parameters.

Conclusion: Data for the above parameters are unacceptable and; therefore, may be removed from the list of selected parameters. Monitoring for assessment may be required.

APPENDIX B
QC Data Tables

Dissolved Solids - Monitoring Samples:
Detection Frequencies and Concentration Ratios

RMDL = 20.0 mg/L

Company	CtrlPt.	N	CLASS	Frequency of Detection (%)			Concentration Ratios (1)			
				>1RMDL	>2RMDL	>5RMDL	Minimum	Median	Maximum	Average

APPENDIX D

Monitoring Data Classification Criteria

QC Flow Charts

General Procedure for Assessment of Monitoring Data

Flow charts for strategies used in assessing the QC data are given at the back of this appendix. The flow chart used is based on a parameters frequency and level of detection.

Parameters were categorized according to their frequency of detection based on the following criteria.

Frequently Found: Greater than 40% of the parameter's observations are above the RMDL.

Infrequently Found: For frequently monitored parameters¹, between 1% and 40% of the parameter's observations are above the RMDL.

For infrequently monitored parameters², between 11% and 40% of the parameter's observations are above the RMDL.

Non-Occurrence: For frequently monitored parameters, less than 1% of the parameter's observations are above the RMDL.

For less frequently monitored parameters, less than 11% of the parameter's observations are above the RMDL.

Within both the frequently and the infrequently found categories parameters were further classified according to the level of detection. Three sub-categories were used for this further classification:

- High Level - Used to describe quantitative data.
- Medium Level - Used to describe semi-quantitative data.
- Low Level - Used to describe qualitative data.

The following criteria for these classifications were used:

Frequent Occurrence:

High Level: Greater than 50% of the parameter's observations are above 5 times the RMDL.

Medium Level: Greater than 50% of the parameter's observations are above 2 times the RMDL.

Low Level: Greater than 40% of the parameter's observations are above the RMDL.

¹Frequently monitored parameters are those monitored thrice-weekly.

²Infrequently monitored parameters are those monitored monthly or quarterly.

Infrequent Occurrence:

- High Level: Of those observations greater than 2 times the RMDL, more than 50% are higher than 5 times the RMDL.
- Medium Level: Of those observations greater than the RMDL, more than 50% are higher than 2 times the RMDL.
- Low Level: Observations do not fit the criteria listed for infrequent occurrence at either the high or medium level.

The following summary for the QC categories can be written:

Frequent Occurrence - High Level

Greater than 50% of the parameter's observations are greater than 5 times the RMDL.

Frequent Occurrence - Medium Level

Greater than 50% of the parameter's observations are greater than twice the RMDL.

Frequent Occurrence - Low Level

Greater than 40% of the parameter's observations are above the RMDL.

Infrequent Occurrence - High Level

For frequently monitored parameters, between 1% and 40% of the observations are above the RMDL, and of those observations greater than 2 times the RMDL, more than 50% are higher than 5 times the RMDL.

For infrequently monitored parameters, between 11% and 40% of the observations are above the RMDL, and of those observations greater than 2 times the RMDL, more than 50% are higher than 5 times the RMDL.

Infrequent Occurrence - Medium Level

For frequently monitored parameters, between 1% and 40% of the observations are above the RMDL, and of those observations higher than the RMDL, more than 50% are higher than 2 times the RMDL.

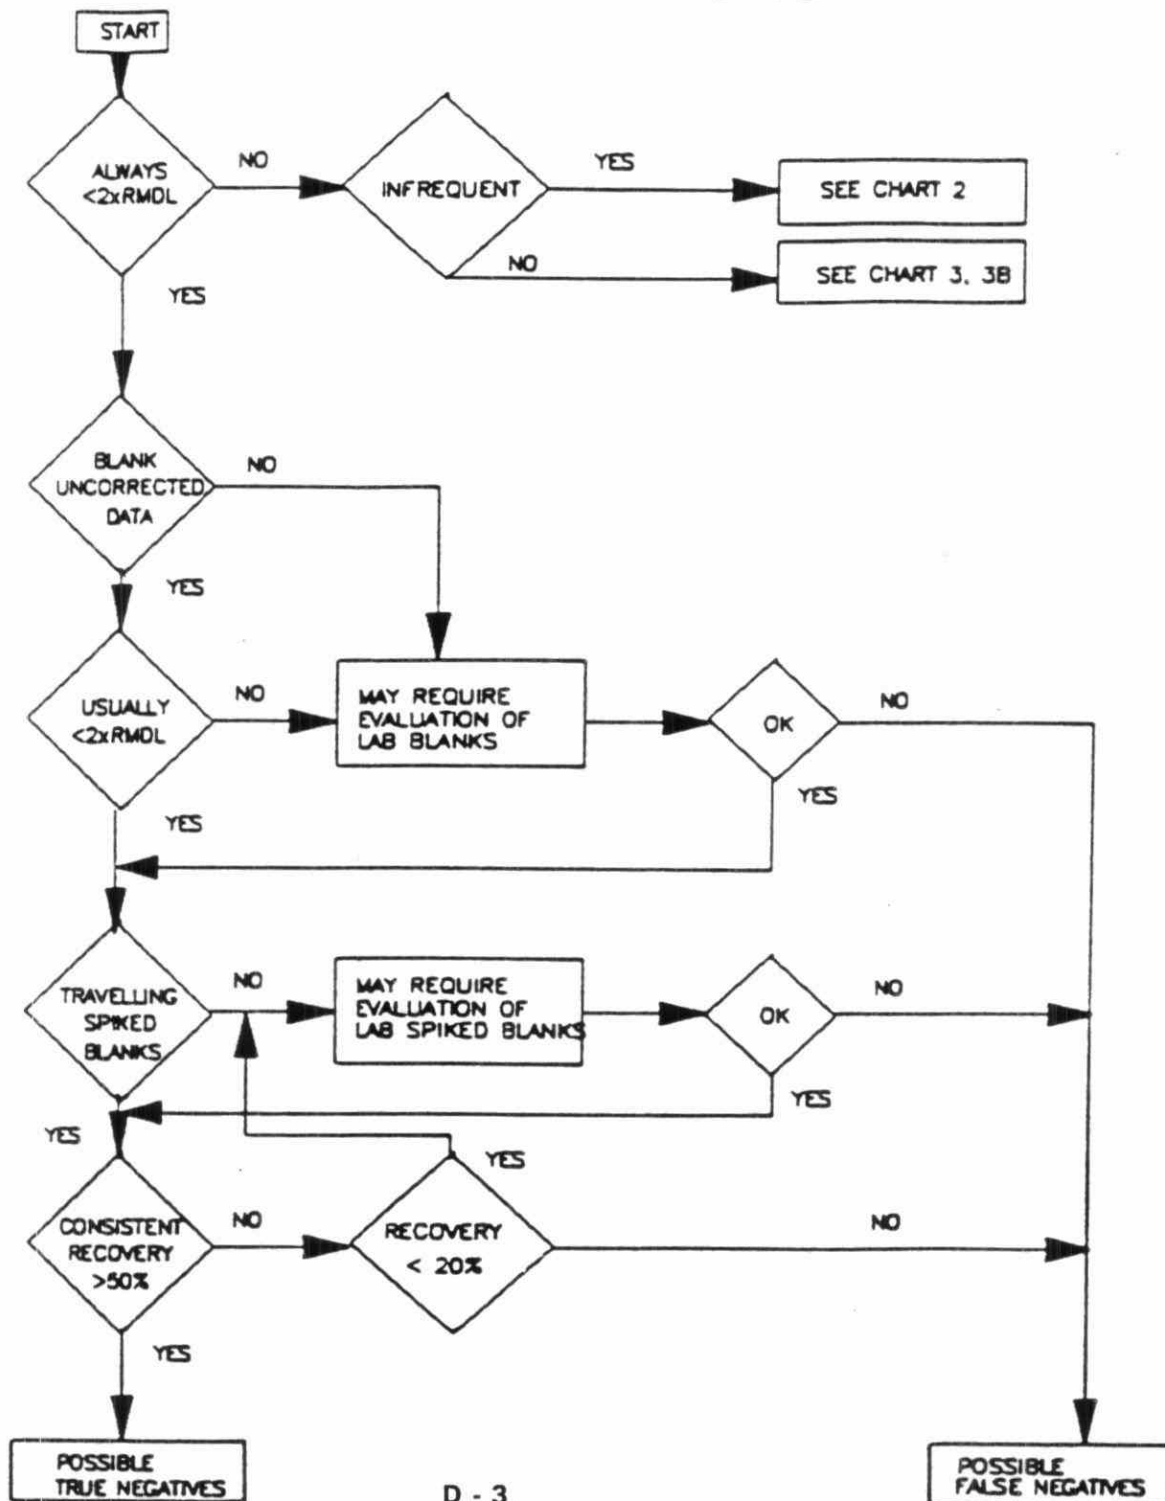

For infrequently monitored parameters, between 11% and 40% of the observations are above the RMDL, and of those observations higher than the RMDL, more than 50% are higher than 2 times the RMDL.

Infrequent Occurrence - Low Level

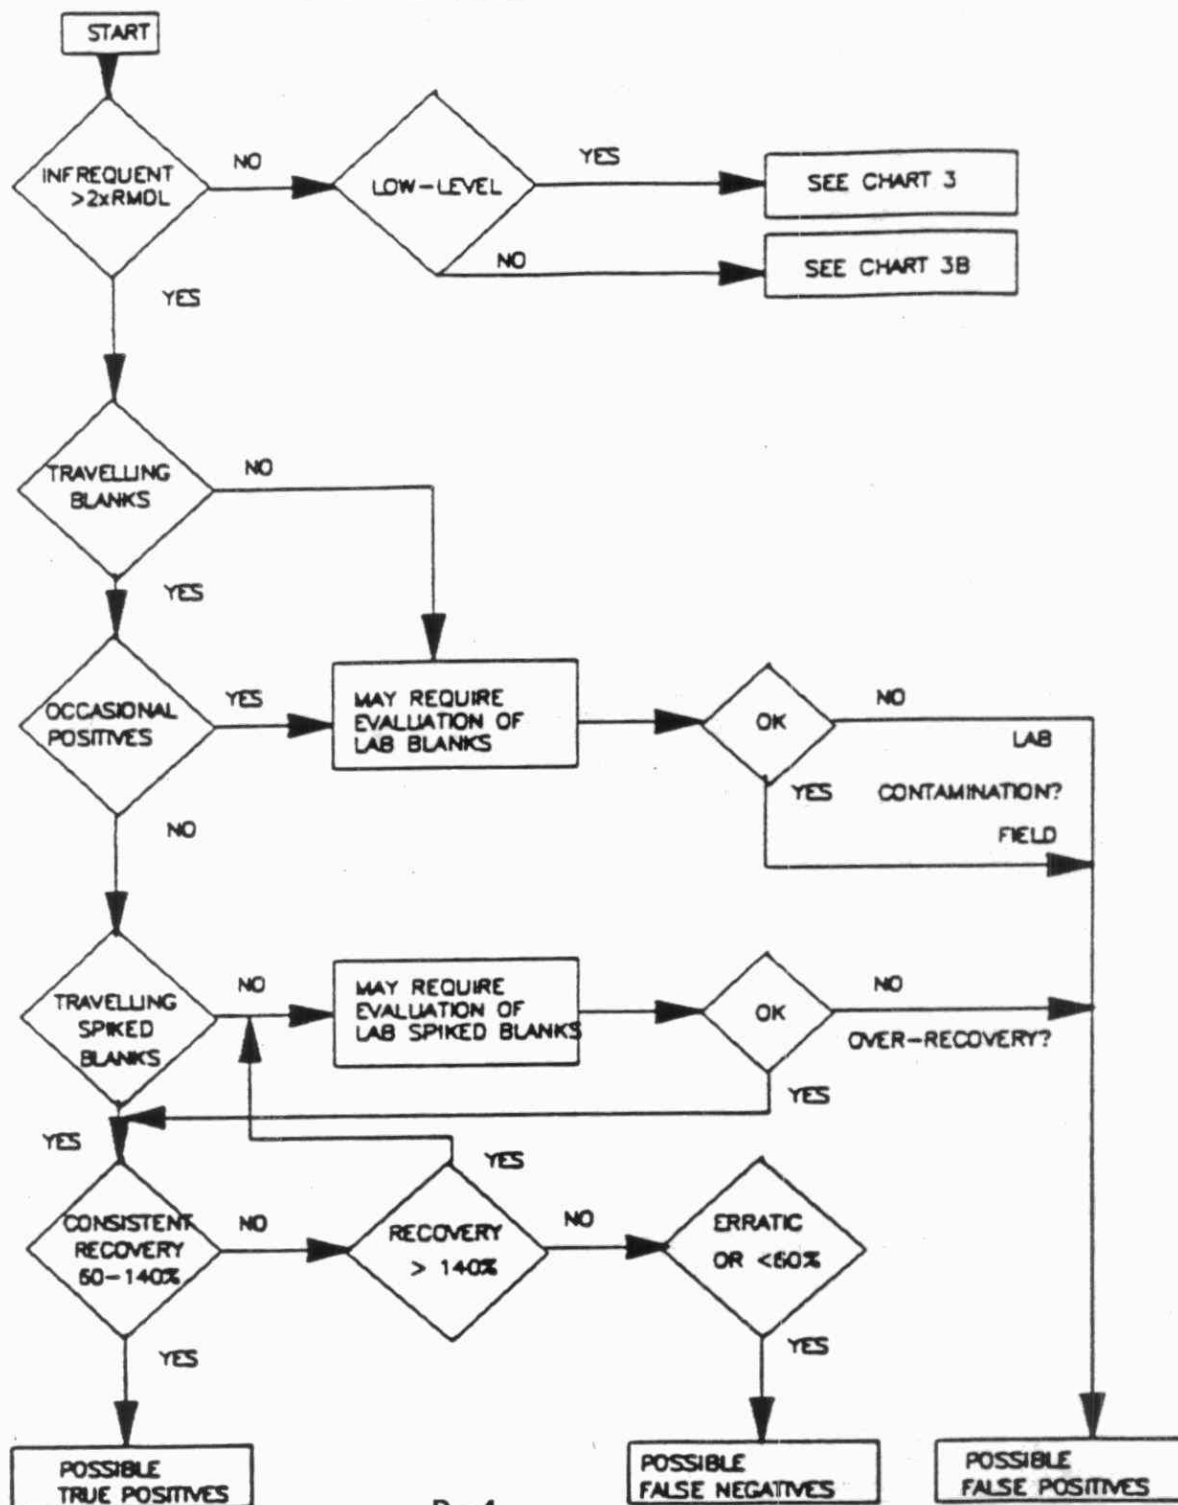

Observations do not fit the criteria listed for infrequent occurrence at either the high or medium level.

The categories discussed above are quite subjective and are used only for the purpose of identifying the predominant QA/QC concerns.

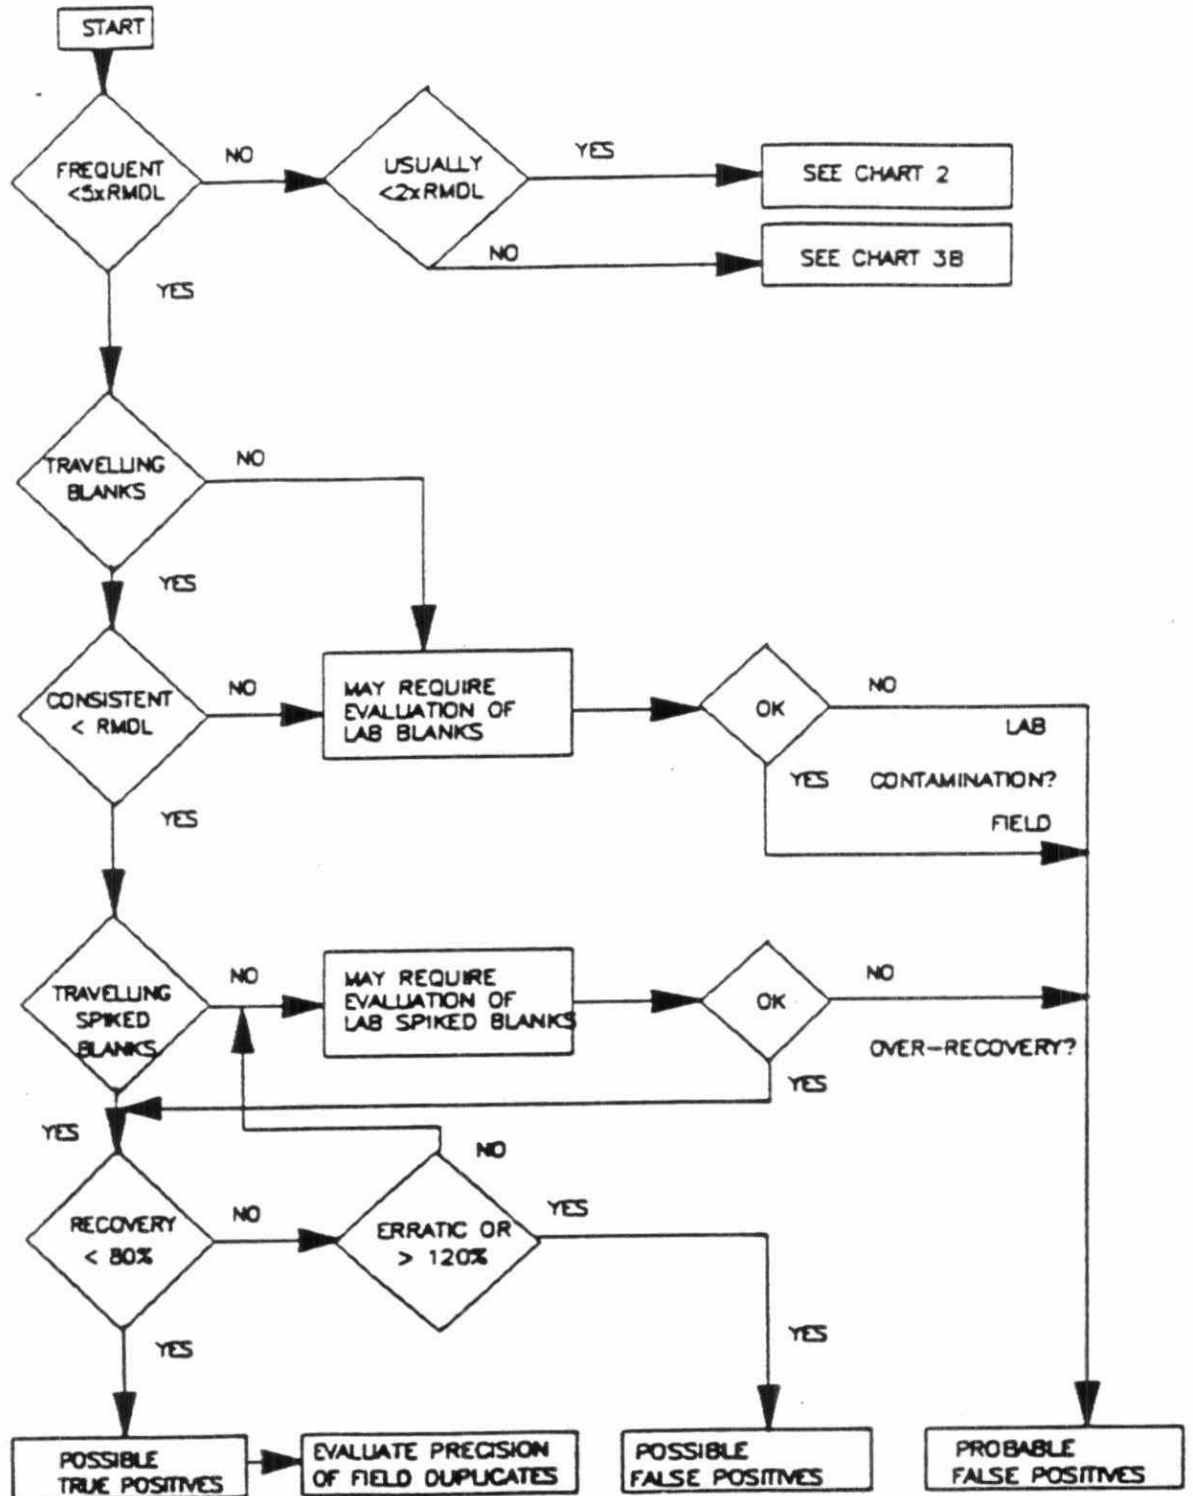

FLOWCHART 1 NON-OCCURRENCE

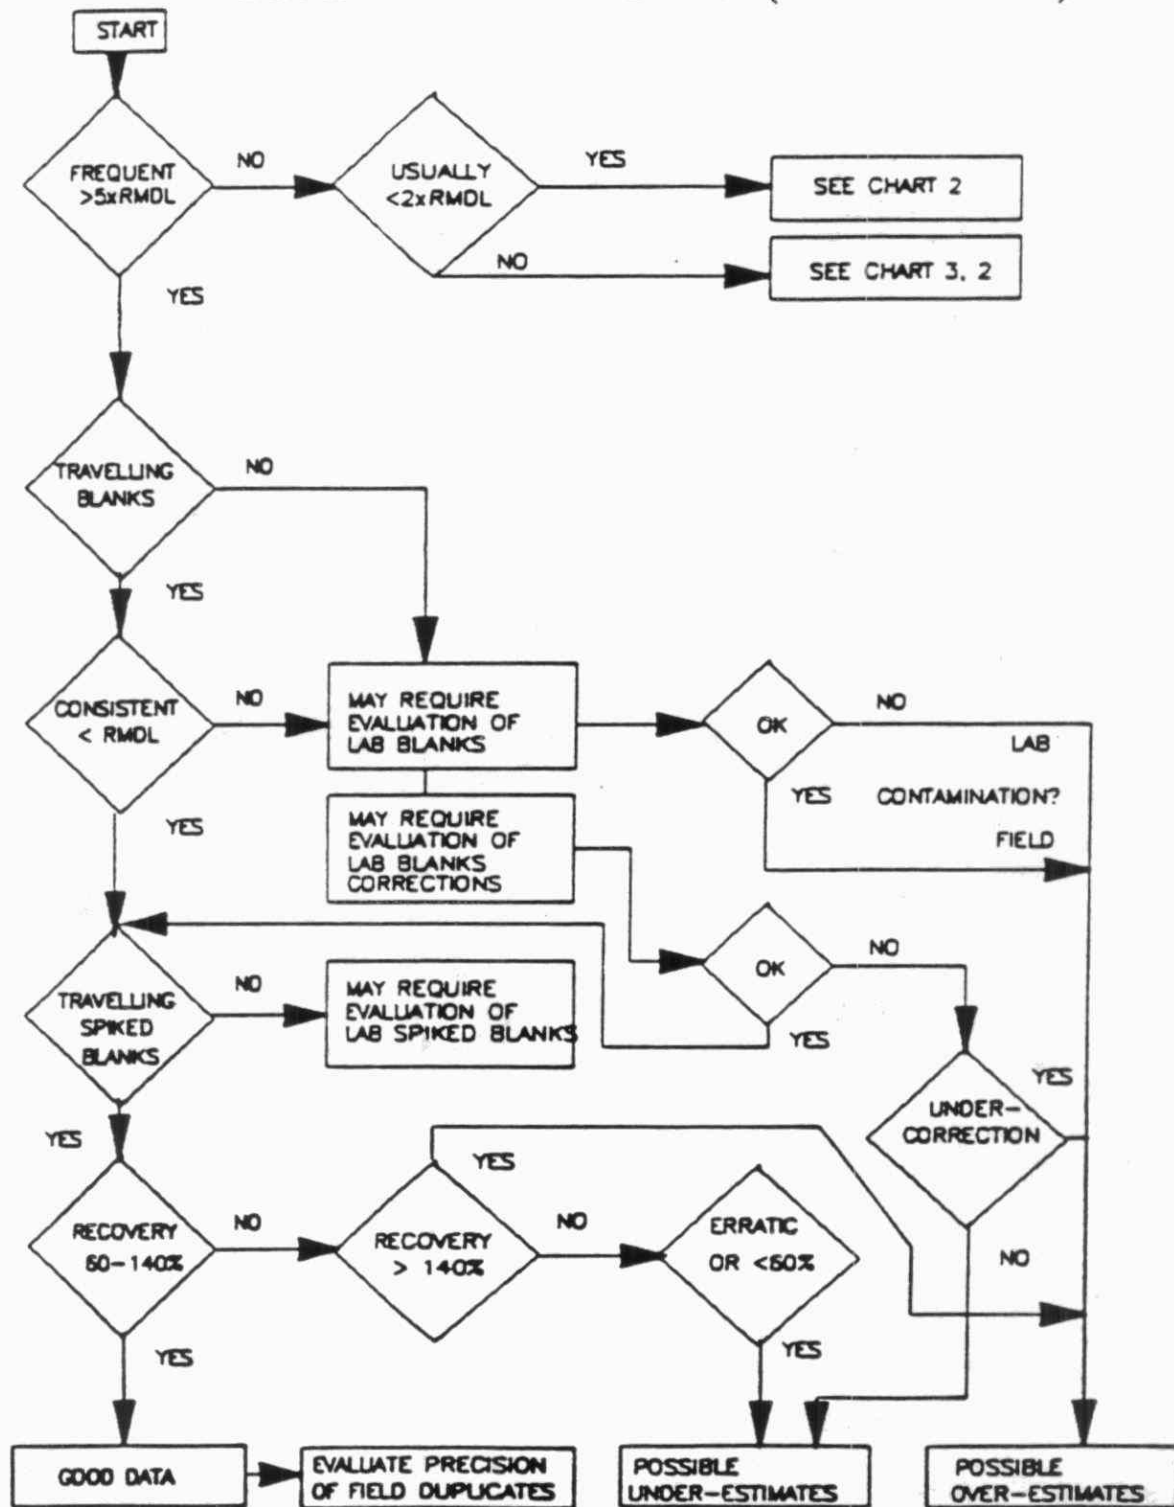

FLOWCHART 2 INFREQUENT OCCURRENCE

FLOWCHART 3 FREQUENT OCCURRENCE (LOW-LEVEL)

FLOWCHART 3B FREQUENT OCCURRENCE (HIGH-LEVEL)

APPENDIX E

Non-selected Parameters with Under-recovery for Travelling Spiked Blanks

Cis-1,3-Dichloropropylene - Travelling Spiked Blanks
Range of % Recoveries

APPENDIX 7

Daily Concentration Plots

MISA Metal Mining Sector
12 - Month Database
February 1, 1990 to January 31, 1991

Nickel, Copper, Lead, Zinc,
Arsenic, Cyanide (Total),
Total suspended Solids, Hydrogen Ion (pH)

1 - INCO, Copper Cliff T.P.
Daily Concentration Plots:

PR 0100 - Final Discharge
February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

1 - INCO, Copper Cliff T.P.

PR 0100 - Final Discharge

MISA METAL MINING SECTOR

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

2 - INCO, Crean Hill Mine

MW 0100 - Minewater

MISA METAL MINING SECTOR

Daily Concentration Plots:

February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

2 - INCO, Crean Hill Mine
Daily Concentration Plots:

MW 0100 - Minewater
February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

2 - INCO, Crean Hill Mine
Daily Concentration Plots:

MW 0100 - Minewater
February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

4 - INCO, Garson Mine
Daily Concentration Plots:

MW 0100 - Minewater
February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

4 - INCO, Garson Mine

MW 0100 - Minewater

MISA METAL MINING SECTOR

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

6 - Falconbridge, Kidd Creek Mine MW 0100 - Minewater
Daily Concentration Plots: February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

7 - INCO, Levack Mine

MW 0100 - Minewater

MISA METAL MINING SECTOR

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

7 - INCO, Levack Mine
Daily Concentration Plots:

MW 0100 - Minewater
February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

7 - INCO, Levack Mine

MW 0100 - Minewater

MISA METAL MINING SECTOR

Daily Concentration Plots:

February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

8 - Falconbridge, Lockerby

MW 0100 - Minewater

MISA METAL MINING SECTOR

Daily Concentration Plots:

February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

8 - Falconbridge, Lockerby

MW 0100 - Minewater

MISA METAL MINING SECTOR

Daily Concentration Plots:

February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

11 - INCO, Nolin Creek T.P.

SW 0100 - Final Discharge

MISA METAL MINING SECTOR

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

12 - Falconbridge, Onaping
Daily Concentration Plots:

MW 0100 - Discharge from Onaping Mine Pond
February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

12 - Falconbridge, Onaping

MW 0100 - Discharge from Onaping Mine Pond

MISA METAL MINING SECTOR

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

Daily Concentration Plots: February 1, 1990 to January 31, 1991

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

16 — INCO, Whistle Mine
Daily Concentration Plots:

MW 0100 — Minewater Discharge
February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

17 - Minnova, Winston Lake Mine PR 0100 - Final Discharge
Daily Concentration Plots: February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

27 - Placer Dome, Dona Lake Mine PR 0100 - Final Discharge
Daily Concentration Plots: February 1, 1990 to January 31, 1991

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

31 - Canamax, Kremzar Mine

PR 0100 - Effluent from SE Clearwater

MISA METAL MINING SECTOR

Daily Concentration Plots: February 1, 1990 to January 31, 1991

12-MONTH MONITORING DATA

35 - Canamax, Marhill Mine

MW 0100 - Minewater

MISA METAL MINING SECTOR
12-MONTH MONITORING DATA

Daily Concentration Plots: February 1, 1990 to January 31, 1991

Daily Concentration Plots: February 1, 1990 to January 31, 1991

Daily Concentration Plots: February 1, 1990 to January 31, 1991

APPENDIX 10

**ACUTE LETHALITY DATA FOR ONTARIO'S
METAL MINING SECTOR EFFLUENTS
COVERING THE PERIOD FROM
FEBRUARY 1990 TO JANUARY 1991**

G.F. Westlake, J.T. Lee, D.G. Poirier,
S.G. Abernethy and M.C. Mueller

Aquatic Toxicity Unit
Water Resources Branch
Environment Ontario

April, 1992

SUMMARY

Under the MISA program, the Metal Mining Sector was required to conduct laboratory toxicity tests to monitor its wastewater discharges for acute lethality to rainbow trout and to *Daphnia magna*. This requirement was based on the Ontario Environmental Protection Act, which allows the Ministry to write regulations requesting persons responsible for sources of contaminants to monitor, record and report to the Ministry. The requirements for toxicity testing are in the General Effluent Monitoring Regulation (Ontario Regulation 695/88) and in the Effluent Monitoring Regulation For The Ontario Mineral Industry Sector: Group A (Ontario Regulation 491/89). Some additional information is in, "The Development Document For The Effluent Monitoring Regulation For The Ontario Mineral Industry Sector: Group A" (Env. Ont. 1989). The monitoring data will be used, in part, to develop effluent limits for acute toxicity. This report is a compilation of the toxicity data for samples collected for the MISA monitoring year from February 1990 to January 1991, and for audit samples tested at the Ministry's laboratory in Rexdale. It also includes data from a few inspection samples taken between February, 1991 and October, 1991.

The regulatory toxicity tests were conducted by standard procedures (Protocol To Determine The Acute Lethality Of Liquid Effluents To Fish, Env. Ont. July 1983 and *Daphnia magna* Acute Lethality Toxicity Test Protocol, Env. Ont. April 1988). In these tests, the organisms are exposed to undiluted effluent and several effluent dilutions for a fixed period. The trout toxicity test is a 96 hour exposure, and a *Daphnia* toxicity test is a 48 hour exposure. The number of organisms that died is the toxic effect that is recorded. The quantitative measure of toxicity is the median lethal concentration (LC50) which is the concentration of effluent estimated to cause mortality to 50% of the test organisms.

The frequency of sampling was quarterly for all sites, however, exploration sites and sites with intermittent discharges were exempted from all or part of their sampling requirements.

The following sites were missing samples for part of the year because they had intermittent discharges: Kidd Creek Mine, Kidd Township, 4th quarter; Whistle, Sudbury, 1st and 3rd quarters; Bell Creek, Timmins, 1st, 2nd, and 3rd quarters; Dome Mine, Timmins, 4th quarter; ERG Resources, Timmins, 1st, 2nd, and 3rd quarters; Renabie Gold Mines Ltd., Renabie, 1st quarter; St. Andrews Gold Fields, Stock Township, 1st, 2nd, and 3rd quarters; Algoma Ore Division, Wawa, 3rd and 4th quarters; Dona Lake Mine, Pickle Lake, 4th quarter; Golden Giant Mine, Hemlo, 1st, 2nd, and 3rd quarter; Arthur W. White, Golden Township, 1st quarter; Pronto, Spragge, 3rd quarter.

The following sites were listed in the monitoring regulation but: A) were not required to

perform toxicity testing because of their exploration development status in the monitoring regulation; or B) did not have enough discharge volume to sample at any time of the year; or C) suspended mining activities before the regulation came into effect; or D) did not submit toxicity results due to unexpected economic or legal circumstances: Aquarius Mine, Timmins; Ateba Mines Ltd., Beardmore; Aunor-Delnite, Timmins; Broulan Reef, Timmins; Chesbar Resources Inc., Chester Township; Citadel Gold Mines Inc., McMurray Township; Jerome Mine, Osway Township; Magnet Mine, Errington Township; Majino Mine, Finan Township; Mishibishu Lake, Wawa; Opamisken Lake, Pickle Lake; Owl Creek Mine, Timmins; Ross Mine, Timmins; Scadding Mine, Scadding Township; Leroy Project, Gowanda; Penna Mine, Coleman Township; Magnacon Mine, Wawa, Paymaster Gold Mines Ltd., South Porcupine.

Toxicity test results from 10 samples were submitted but were not put into the database because either the test protocol was not followed (4 tests including samples with minor violations of the test protocol from Metallurgical Site, Falconbridge Ltd., Hoyle Township; Renabie Gold Mines, Renabie; Refinery, Cameco, Blind River; David Bell Mine, Hemlo) or there were electronic problems with the submission (6 tests including samples from Kidd Creek Mine, Kidd Township; Metallurgical Site, Falconbridge Ltd., Hoyle Township; Refinery, Cameco, Blind River where the trout and *Daphnia* data were submitted on the same disk and they could not be loaded).

The monitoring occurred at 51 sampling locations at 46 sites. For 11 sites, samples were consistently lethal to one or both of the test animals. For 6 sites, samples were frequently, but not always lethal to one or both animals. For 14 sites, samples were sometimes lethal to one or both of the test animals. From the remaining 15 sites, samples were normally non-lethal to both animals. For the period of February, 1990 to October, 1991, the Ministry reviewed the results for 217 trout and 212 *Daphnia* tests. For trout: 118 samples were nonlethal, 38 samples had $LC50s > 100\%$ effluent and 61 samples were lethal ($LC50 < 100\%$ effluent). For *Daphnia*: 91 samples were nonlethal, 57 samples had $LC50s > 100\%$ effluent and 64 samples were lethal ($LC50 < 100\%$ effluent).

The Ministry of the Environment's Aquatic Toxicity Unit performed 103 audit tests over the monitoring period, and found that the results of audits were generally consistent with the results submitted by industry. The differences that were observed between the results can be explained primarily by variability in effluent quality; the audits were not tests of split samples.

A preliminary interpretation of the toxicity results, concerning the possible causes of acute lethality, is given below. The Toxicity Test Reports for the samples, reports summarizing the analytical chemistry data for each process effluent, as well as plots from the electronic database were used for this purpose.

BASE METAL MINES CONCENTRATORS AND REFINERIES.

The final discharge of the Copper Cliff Treatment Plant, Inco, Sudbury; the final discharge at Geco Division, Noranda Minerals, Manitouwadge; the minewater discharge of the Kidd Creek Mine, Falconbridge Ltd., Kidd Township; the minewater at the Levack site, Inco Ltd., Sudbury; the discharge from the mine pond at the Onaping mine, Falconbridge Ltd., Sudbury; and the final discharge of the refinery, Inco Ltd., Port Colborne were all frequently lethal to trout. In all but the Onaping mine, copper levels alone were high enough (above 0.1 mg/L) to explain at least part of the observed toxicity to trout (Provincial Water Quality Objective Development Document for Copper, MOE, 1997). In all but Geco, pH levels were high enough (above 10) to cause acute lethal effects on trout. Ammonia (at Geco and Onaping), zinc (at Kidd Creek) and nickel (at Levack) are other effluent constituents of these effluents that may have contributed to the toxicity to trout.

The final discharge at Geco Division, Noranda Minerals, Manitouwadge; the minewater discharge of the Kidd Creek Mine, Falconbridge Ltd., Kidd Township; the discharge from the mine pond at the Onaping mine, Falconbridge Ltd., Sudbury; the minewater at the Whistle mine, Inco Ltd., Sudbury; and the final discharge of the refinery, Inco Ltd., Port Colborne were all frequently lethal to *Daphnia*. Except for the Whistle mine, which was probably lethal to *Daphnia* due to high pH, all the other discharges had high enough levels of copper ($>0.1\text{mg/L}$) to explain at least part of the observed toxicity to *Daphnia*. In all but Geco, pH levels were high enough (above 10) to cause acute lethal effects on *Daphnia*. Ammonia (at Geco and Onaping) and zinc (at Kidd Creek) are other constituents of these effluents that may have contributed to the toxicity to *Daphnia*.

There were some samples toxic to either test animal from several of the other base metal mines and refineries. The small number of samples coupled with the variability of effluent quality from one sampling time to the next does not provide data sufficient to identify the toxic chemicals. Samples from the Nickel Refinery, Inco, Sudbury and from the Nickel Refinery, Falconbridge, Sudbury caused an unusual form of toxicity to *Daphnia*, called in the rest of this document "bell" shaped toxicity. Typically, at full strength effluent none of the animals die but when diluted slightly, some animals die, then when diluted further more animals survive. The substances causing this are unknown but it should be noted that a single concentration (full strength effluent) test would miss this toxicity

GOLD MINES, CONCENTRATORS AND SMELTERS

The final discharge to Balmer Creek at the Arthur W. White Mine, Dickenson Mines, Golden Township (the same discharge as Campbell Red Lake Mine, Placer Dome) was frequently lethal to *Daphnia*, and on one occasion lethal to trout. This could be explained by copper levels in excess of 0.3 mg/L. Also, arsenic levels in excess of 0.6 mg/L could account for the *Daphnia* lethality. The final discharge at Renabie Gold Mines Ltd., Renabie was frequently lethal to both trout and *Daphnia*. The probable cause was copper in excess

of 0.1 mg/L. Zinc and cyanide could also have contributed to the toxicity. The final discharge of the Detour Lake Mine, Placer Dome Inc., Detour Lake was consistently lethal to *Daphnia* and trout. The samples were normally more toxic to *Daphnia* than to trout. The copper levels were normally above 0.1 mg/L and frequently above 0.3 mg/L. Cyanide may also contributed to the toxicity. The final discharge of the Dome Mine, Placer Dome Inc., Timmins was consistently lethal to *Daphnia* but not to trout. The reason is unclear, but copper in excess of 0.1 mg/L was measured.

There were some samples toxic to either test animal from several of the other gold mines. The small number of samples coupled with the temporal variability in the effluents does not provide enough data to judge the causes of toxicity. One sample from each of the final discharges from the Muskegsagagen Lake mine, Bond Gold Canada, District of Kenora and the final discharge from the Dona Lake Mine, Placer Dome Inc., Pickle Lake had "bell" shaped toxicity curves.

IRON MINES

All samples from Algoma Ore Division, Algoma Steel Corporation, Wawa were non-lethal to both animals.

URANIUM MINES AND REFINERIES

Except for one sample in January 1991 from the Denison Property, Denison Mines Ltd., Elliot Lake, that was lethal to both animals, the final discharge was normally non-lethal. Quirke is sometimes lethal to either animal. One of the *Daphnia* tests had a "bell" shaped toxicity curve. The refinery, (Cameco) in Blind River was normally lethal to both animals. The cause for this was unclear but the refinery discharge does have high levels of oil and grease. The other refinery in Port Hope was consistently non-lethal to both animals. The Stanleigh site, Rio Algom Ltd., was normally non-lethal to both animals, although one sample had a "bell" shaped toxicity curve to *Daphnia* (see previous discussion). The Stanrock property, Denison Mines was normally non-lethal to trout and *Daphnia* but had one toxic sample to trout and two to *Daphnia*. The cause for this is unknown.

CONCLUSIONS

For some samples, *Daphnia* were more sensitive than trout but there were many samples for which the reverse was true. Of the toxic samples from the sector as a whole, about 50 % of the samples were more toxic to trout and the other 50% were more toxic to *Daphnia*. Samples from some sites were more toxic to one animal than to the other but for many other sites, the relative sensitivity of the two animals reverses from one sample to the next, probably due to variations in effluent quality over time. The toxicity database for the Metal

Mining Sector shows that tests of both species are needed to better assess and control the potential impact of these complex and variable effluents on the aquatic environment.

Reduction in pH to below 10 and reduction in copper levels to below 0.1 mg/L would do the most to eliminate acute lethality. Since small adjustments of pH can greatly alter the toxicity of many substances even near neutral pH levels, reduction of toxicity by pH adjustment may only be valuable for effluents outside acceptable pH ranges. Effluents that already have acceptable pH levels may actually increase in toxicity if they are adjusted. The impact of pH cannot be separated from that of the other toxicants because it can have a direct toxic action and a modifying effect on the physical, chemical and toxic properties of other effluent constituents.

The relationship of pH to metal toxicity is complex. There is evidence in the toxicity literature that when measured as total metal, the toxicity of heavy metals tends to increase with decreasing pH in the range of 9 to 7. Recent studies have shown that this can be explained by the overriding change in physical form of the metals towards hydroxides and carbonates that occurs as pH rises from 7 to 9 (Bradley and Sprague, 1987. Can. J. Fish. and Aquatic Sci., 42: 730). In fact, the toxicity of the most toxic forms (dissolved metal ions and hydroxides) actually **decreases** with decreasing pH from 9 to 7. For copper, LC50s regardless of speciation tend to be below 0.1 mg/L at high pH. Unfortunately, none of the literature on metal toxicity deals with pH above 9 so that the impact of pH adjustment should be investigated on a site by site basis. It is clear, however, that pH itself is acutely lethal above 10 and causes sublethal effects above 9. It is also clear that copper above 0.1 mg/L can be lethal depending on conditions and is almost always lethal above 0.3 mg/L (Howarth and Sprague, 1977. Water Research, 12: 455). There were only 3 individual samples for the whole sector where the sample was non-lethal to trout yet the copper concentration measured on the same day was over 0.3 mg/L.

Ammonia is a common toxicant at a number of the sites in the metal mining sector. A review of acute lethality in relation to total ammonia is difficult since even at values that the toxicological literature predicts would be acutely lethal do not always result in acute lethality in these tests. It is possible that ammonia is being lost during shipping for the toxicity tests or that some mitigating factor is present in the effluent mixtures. There are a few sites where ammonia values are so high that they are probably at least contributing to the acute lethality observed. These sites have been mentioned above.

The toxicity tests will detect harmful concentrations and mixtures of most chemical constituents of effluents. But compliance with end-of-pipe limits for acute toxicity would not necessarily control the potential effects of environmental contamination that can be caused by the loading of bioaccumulative substances. These substances are generally nonpolar organic chemicals of high molecular weight and low water solubility or metals such as mercury which accumulate in its organic forms or cadmium which can cause permanent damage at sublethal levels accumulating over the life span of aquatic animals. Neither mercury or cadmium were identified as major problems for this sector in Ontario.

TABLE 1: PROVINCIAL WATER QUALITY OBJECTIVES AND GUIDELINES - JULY 1991

LEGEND

- (a) PWQO/G is either a narrative, or dependent on pH, alkalinity, or hardness;
see Blue Book Table 1 and tables below
- (c) proposed PWQG's are available for some isomers of dimethylphenol
- (d) PWQO is for MONOCHLOROPHENOL (7 µg/L)
- (f) PWQO is for DIETHYLHEXYLPHTHALATE (0.6 µg/L)
- (g) PWQO is for DIBUTYLPHTHALATE (4.0 µg/L)
- (h) PWQO is for OTHER PHTHALATES (0.2 µg/L)
- (j) PWQO/G is available for total PCB's, for total resin acids and for DHA,
but not other individual isomers
- PWQG = Provincial Water Quality Guideline
PWQO = Provincial Water Quality Objective

ALUMINUM, PHOSPHORUS AND RESIN ACID GUIDELINES

PARAMETER	PROVINCIAL WATER QUALITY GUIDELINE
ALUMINUM, INORGANIC MONOMERIC	0.015 mg/L, at pH 4.5 to 5.5 measured in day-free samples
ALUMINUM, ACID SOLUBLE INORGANIC	<10% increase above avge. background at pH>5.5-6.5 in day free samples
ALUMINUM, TOTAL	0.075 mg/L at pH 6.5-9.0 measured in day free samples
DEHYDROABIETIC ACID	see footnote 1
RESIN ACIDS, TOTAL	see footnote 1
PHOSPHORUS, TOTAL	To avoid nuisance algae concentrations in lakes, total P should not exceed 20 µg/L
	To protect against aesthetic deterioration in lakes, total P should not exceed 10 µg/L
	To avoid excess plant growth in rivers & streams, total P should not exceed 30 µg/L

(1) Total resin acids and DHA are pH
dependent as shown below:

Receiving water pH	DHA (µg/L)	Total Resin Acids (µg/L)
5	1	1
5.5	1.9	3
6	2.5	4
6.5	4.2	9
7	8	25
7.5	11.8	45
8	12.9	52
8.5	14	60
9	14.3	62
